Bureau of Commercial Fisheries
Washington 25, D. C.*

United States Tuna Clipper

Length in Feet	68 to 150
Beam in Feet.	20 to 32
Draft in Feet.	8.6 to 15.4
Net Tonnage	60 to 300
Construction	Steel or Wood
Engine: Type	Diesel
Horsepower	250 to 1200
Type of Refrigeration.	Mechanical or Brine Tanks
Cruising Speed	10 to 12 Knots
Average Crew	9 to 21
Length of Trip	35 to 85 Days
Convertibility to Other Types of Gear	None

Cover: Tuna Clipper

8291 - 001 - 8915

CATCH AND SUPPLY OF BONITO AND YELLOWTAIL

Bonito and yellowtail catch, Pacific Coast States (table)	10
Bonito and yellowtail catch by area of capture, Pacific Coast States (table)	11
Supply, canned bonito and yellowtail (table)	11
Imports, canned bonito and yellowtail (table).	12

CATCH OF TUNA

The tunas are one of the United States' leading fishery resources. In 1958, as in the two preceding years, tunas were taken domestically in greater volume than any other foodfish, and they ranked third in the value of the catch. Five species are taken generally by United States fishermen. These are the albacore, bluefin, little, skipjack, and yellowfin. In addition, bonito and yellowtail are packed tuna-style and known as "tunalike fishes". However, they cannot be labeled "tuna".

The taking of impressive quantities of tuna on the Pacific Coast, where most of the United States catch is made, is of comparatively recent origin. Tuna were well known to Southern California anglers prior to the twentieth century. However, the fish were not considered edible and the catches were usually discarded.

Failure of the Pacific sardine to appear in the San Pedro area in 1903 was primarily responsible for the development of the tuna fishery. In an effort to keep his cannery operating, a packer canned 700 cases of tuna which were distributed to wholesalers. Repeat orders were received and, by 1907, a small tuna canning industry began to move out of the experimental stage. By 1914, eleven canneries were operating and the industry was becoming well established. In 1958, a total of 36 canneries in 7 States, American Samoa, Hawaii, and Puerto Rico produced a pack of 277 million pounds of canned tuna and 2 million pounds of bonito and yellowtail. In the same year, 46 million pounds of canned tuna and 12 million pounds of bonito and yellowtail were imported into the United States.

When the tuna fishery first started in Southern California, albacore was the only species taken for canning. However, it was found that runs of albacore were erratic and catches of skipjack, yellowfin, and bluefin were reported in 1916.

The fishery grew rapidly and the catch totaled nearly 100 million pounds in 1930. In 1940 it passed 200 million pounds, and a peak of 390 million pounds was reached in 1950. As the demand for tuna increased, local supplies off Southern California were found to be inadequate and it became necessary for vessels to make voyages south of the Mexican boundary, off Central and South America, where large concentrations of skipjack and yellowfin were available throughout the year. In 1927, for the first time, the catch south of the boundary exceeded production off California. Catches off Central and South America continued to grow rapidly and, in most years since

1947, over 90 percent of the Pacific Coast catch has been taken from waters south of the Mexican border.

Albacore--the only species permitted to be marketed in the United States as white meat tuna--continued to be the principal species taken through 1925. However, after that year the fish nearly disappeared and the catch declined to less than 2,500 pounds in 1933. In 1935, they reappeared in volume off Southern California and, in 1937, were found off the coasts of Washington and Oregon. The catch increased spectacularly, reaching a peak of 72 million pounds in 1950.

Bluefin have been taken by Pacific fishermen in smaller quantities than the other species. In 1958, a record catch of nearly 31 million pounds exceeded the former peak production of 1935 by almost 6 million pounds.

The skipjack--smallest of the commercial tunas--is probably the most abundant. Catches increased steadily after fishermen began taking them in volume in 1918. In 1950, production exceeded 100 million pounds for the first time and has averaged over 114 million pounds annually since that year. Skipjack and yellowfin are taken principally in the same areas by the same boats and type of gear. Therefore, generally speaking, there is a single fishery for the two species.

Yellowfin is the principal tuna taken by Pacific fishermen. Catches first exceeded 100 million pounds in 1939 and, since 1946, have ranged from 119 million pounds to a peak of 199 million. Yellowfin and skipjack are the principal species taken by the large, picturesque tuna clippers or bait boats--vessels which may cost nearly a million dollars and have a carrying capacity of over 600 tons.

A small tuna fishery has been carried on in the North Atlantic for many years. Bluefin is the principal species taken. However, the catch of these fish in any year has not exceeded three million pounds. Little tuna, taken principally in the Middle Atlantic States, have been reported since 1945. The peak production was in 1952, when 747 thousand pounds were landed. Exploratory fishing operations have shown that considerable quantities of yellowfin tuna occur in the Gulf of Mexico and in offshore Atlantic waters. A small fishery for yellowfin has been conducted in the Gulf of Mexico since 1951. The largest catch was made in 1957, when 666 thousand pounds were landed.

TUNA CATCH BY SPECIES, PACIFIC COAST STATES, 1911 - 1958

CATCH OF TUNA OFF THE PACIFIC COAST STATES AND LATIN AMERICA, 1911 - 1958

SUPPLY OF TUNA

The consumption of canned tuna in the United States has increased almost continuously since the inception of the domestic industry. The supply--domestic pack plus imports--first exceeded 100 million pounds in 1947. Only three years later, it passed the 200-million-pound level and reached a peak of 323 million pounds in 1958.

While the consumption of tuna in the United States has increased, the United States tuna fleet has been faced with increased competition from imports. The trend has been to obtain an increasing portion of domestic requirements from imports. In 1939, 83 percent of the supply consisted of tuna canned from domestically-caught fish. By 1955, the percentage had declined to only 48.9 and in 1958 had dropped still further to 46.2 percent.

The industry and Governmental agencies concerned with the welfare of the tuna fishery have devoted a great deal of attention to the industry's problems. Detailed tuna catch, pack, import, and

supply tabulations have been prepared as the basis for studies of the fishery and for use in presenting the various facets of the tuna problem.

The many sources of tuna data and the necessity of using conversion factors to present information on a similar basis has made it difficult for those concerned with the tuna fishery to assemble comparable catch, pack, and import data. In an effort to eliminate confusion in the use of statistics on the tuna industry, the following tables have been prepared. The data contained in these tables are the official Bureau figures on the total domestic catch, pack, and imports of tuna.

Data on the catch of tuna were obtained from the records of State fishery agencies or collected by the Bureau of Commercial Fisheries. Information on the canned pack was obtained from canners by the Bureau. Basic import statistics were obtained from records of the Bureau of Census, Department of Commerce.

UNITED STATES SUPPLY OF FRESH AND FROZEN TUNA, 1950 - 1958
(Round Weight Basis)

SUPPLY OF CANNED TUNA, 1948 - 1958

CATCH AND SUPPLY OF BONITO AND YELLOWTAIL

The bonito is related to both the mackerel and the tuna. In California, where the major portion of the domestic catch is made, bonito is often taken by tuna fishermen and canned tuna-style. However, Federal regulations prohibit labeling the pack "tuna." Instead, the labels must bear the designation "bonito." The peak catch of bonito occurred in 1947, when 14 million pounds were landed in California. The average catch has been far below that amount. The 5 million pounds of bonito landed in California during 1958 were considerably more than the 161 thousand pounds average annual catch taken during the three years from 1955 to 1957.

The Pacific yellowtail is considered a tunalike

fish, and, like bonito, the canned pack is included in statistics showing the production of "tuna and tunalike fishes." However, yellowtail are not tuna, but members of the jack family (Carangidae), which includes the jack mackerel, the scad, and many other tropical species. They cannot be labeled "tuna" but must be designated "yellowtail." Yellowtail are an important sport fish in southern California and most of the catch north of the Mexican border is made by sportsmen. The record catch of yellowtail occurred in 1918, when 12 million pounds were taken. In recent years the catch has declined sharply and, in the years from 1955 to 1958 inclusive, has averaged only 386 thousand pounds.
