

MARQUESAS AREA OCEANOGRAPHIC AND FISHERY DATA, JANUARY-MARCH 1957

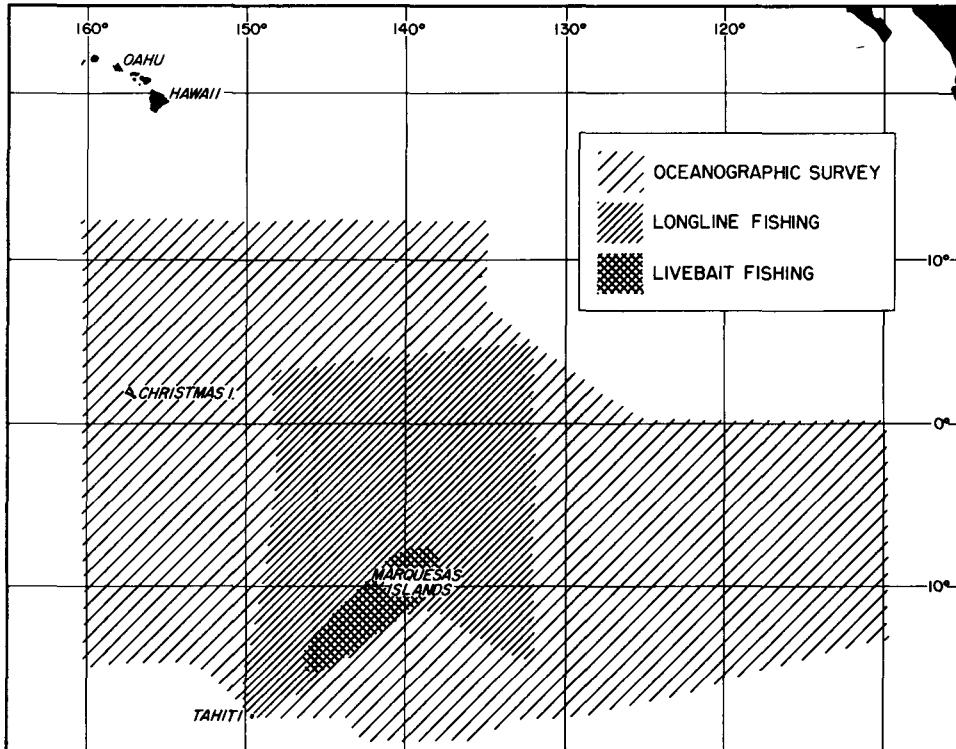

SPECIAL SCIENTIFIC REPORT-FISHERIES No. 238

**UNITED STATES DEPARTMENT OF THE INTERIOR
FISH AND WILDLIFE SERVICE**

Explanatory Note

The series embodies results of investigations, usually of restricted scope, intended to aid or direct management or utilization practices and as guides for administrative or legislative action. It is issued in limited quantities for the official use of Federal, State or cooperating Agencies and in processed form for economy and to avoid delay in publication.

Special Scientific Report--Fisheries No. 238

WASHINGTON: SEPTEMBER 1957

ABSTRACT

This report presents physical, chemical, and biological observations by a 3-vessel survey of the portion of the southeastern Pacific Ocean which is centered in the Marquesas Islands. The expedition was conducted during the southern hemisphere summer, January-March 1957. The methods for field collection of data and laboratory analysis of samples are described. The observed data are presented without analysis. The Hugh M. Smith made physical, chemical, and biological observations in order to define the features of the oceanic circulation and describe the distribution and abundance of phytoplankton and zooplankton. The Charles H. Gilbert made a survey of the stocks of tuna available to live-bait fishing in the Marquesas and Tuamotus, and of the tuna-bait resources in the Marquesas. The John R. Manning made a survey of the deep-swimming tunas available to fishing with longline gear.

MARQUESAS AREA OCEANOGRAPHIC AND FISHERY DATA,
JANUARY-MARCH 1957

By

Robert C. Wilson, Fishery Research Biologist
and
Murice O. Rinkel, Oceanographer
Pacific Oceanic Fishery Investigations
U. S. Fish and Wildlife Service
Honolulu, T. H.

This report presents the record of observed data from a survey of that portion of the southeastern Pacific Ocean centered in the Marquesas Islands. It is the second POFI report concerning this area; the first (Austin 1957) contains the results from a similar endeavor during August-September 1956. The surveys are part of a program undertaken by the Pacific Oceanic Fishery Investigations (POFI) to study the tuna resources of the southeastern Pacific. The August-September cruises were also part of a broad-scale coverage of the equatorial Pacific, designated operation EQUAPAC.

To make these data rapidly available to other agencies studying the Pacific Ocean, they are presented here without analysis. Descriptive and analytical reports will follow.

Three POFI research vessels were assigned to the survey, each with a different primary mission. The oceanic circulation and productivity of a broad area about the Marquesas was studied by the Hugh M. Smith. The Charles H. Gilbert obtained a measure of the tuna available to live-bait fishing and surface trolling, while the John R. Manning investigated the availability of deep-swimming tuna to long-line gear.

The Smith departed Honolulu January 11, 1957, and returned March 26, after having occupied the oceanographic stations shown in figure 1. The cruise was interrupted by a breakdown on January 31. Repairs were effected at sea, and the cruise resumed on February 24, but with some change in the cruise plan.

The Gilbert departed Honolulu January 11, 1957, and returned March 22, after having conducted surface live-bait tuna fishing and surface trolling in the areas shown in figure 2.

The Manning departed Honolulu January 4, 1957, and returned March 12, after having occupied the longline-fishing stations shown in figure 3.

FIELD PROCEDURES

Oceanography and Meteorology

The Smith occupied 57 oceanographic stations (table 1) during the survey period. Nansen bottle casts were made to a depth of 1,200 meters with 13 bottles per cast. The spacing of the Nansen bottles in the upper 200 meters was determined from the temperature characteristics of a bathythermograph trace obtained just before the hydrographic cast.

Water samples were drawn from each bottle for salinity, oxygen, and inorganic-phosphate determinations. The oxygen determinations were made aboard the vessel by the modified Winkler method. No oxygen samples were taken during the breakdown period. Analysis of samples for inorganic phosphate were also made aboard by use of the hydrazine-sulphate modification of Denige's method (King et al. 1957) and a model B, Beckman spectrophotometer. Phosphate samples collected during the breakdown period, on special casts, and at 7 oceanographic stations were frozen for analysis in the laboratory ashore. All the salinity samples taken during the cruise were analyzed ashore.

In addition to the regular oceanographic stations, two special 300-meter casts with 8 Nansen bottles, spaced according to the vertical temperature characteristics, were made for the purpose of collecting water samples for phytoplankton analysis (see fig. 1). On one regular oceanographic station, additional phytoplankton samples were drawn from bottles at selected depths. All of these samples were shipped to the Institutt for Marin Biologi at Oslo, Norway.

During the cruise, 275 bathythermograph observations were made from the Smith (table 2). Lowerings were made every 6 hours between Honolulu and the Equator. Between oceanographic stations, lowerings were made every 3 hours on the run along the Equator and

every 4 hours along the 110°W. meridian. On the remainder of the cruise, one lowering was made between stations 90 miles apart, and two between stations 120 miles apart. During the drifting period, in addition to station casts, 16 BT observations were taken at various times. BT casts were made just before and after each oceanographic station.

BT observations from the Gilbert numbered 240 (table 3). They were made every 6 hours while running between Honolulu and 11°N., and between the Marquesas and Tahiti, and every 3 hours on runs between 11°N. and the Marquesas. A single lowering was made at each surface fishing station in the Marquesas and Tuamotus.

The Manning cruise data included 240 BT records (table 4). The lowerings were made every 6 hours traveling to, from, and between the lines of longline fishing stations. A lowering was made just after setting the longline gear, just before and after retrieving it, and midway between fishing stations.

Surface water samples for salinity analysis were taken by the Smith at each BT lowering between Honolulu and the Equator, also at each BT lowering between oceanographic stations north of 2°N., and occasionally at BT lowerings during the rest of the cruise. These data are included in table 2.

Surface water samples for the determination of salinity and inorganic phosphate were taken from the Gilbert once a day between Honolulu and 5°N., and at alternate BT lowerings between 5°N. and the Marquesas. Salinity samples were taken at each live-bait fishing station. All samples were analyzed ashore (table 5).

From the Manning, surface salinity samples (table 4) were taken at every other BT cast on runs to, from, and between lines of fishing stations, and at each fishing station.

On all vessels, standard weather observations were made 4 times daily, except they were omitted when the vessels were in bays or harbors. They were made only twice daily during the breakdown period of the Smith, and the 1200 (GMT) observation was not taken on the Gilbert and Manning during fishing periods. The observations, as encoded and recorded on USWB Form 1210-F, are presented in tables 6, 7, and 8.

Water transparency and color observations were made from both the Smith and the Gilbert. The transparency measurements were made with a standard 30-cm. Secchi disc; water color was designated by comparison with the Forel standards. These data are presented in tables 9 and 10.

Productivity observations

The rate of carbon fixation by photosynthesis was determined with the radioactive carbon (C^{14}) method, as developed by Steemann Nielsen (1952) and modified by Doty (King et al. 1957), employing water samples taken from the Smith. Surface inorganic phosphate analyses were obtained simultaneously with the C^{14} determinations. These data are presented in table 11.

Three types of plankton hauls were made from the Smith, all with a 1-meter net of 656 Nitex (aperture width 0.66 mm.). Except during the runs between Honolulu and the Equator, an oblique 0-60 meter, 30-minute haul was made each day at about 1130 local time, at the same time as the C^{14} sampling. Each night between 2000 and 2200 local time, an oblique two-net tandem haul was conducted, sampling at 0-60 meters and 0-200 meters. Immediately following this, paired 30-minute surface tows were made. The station data and plankton volumes are presented in table 12.

Eight 30-minute surface tows, employing a similar 1-meter net, were made from the Gilbert in the vicinity of the Marquesas and Tuamotus. The station data and plankton volumes are presented in table 13.

Surface trolling

Except when otherwise engaged, all the vessels did surface trolling during daylight hours with varying numbers of lines. The catches and related data for each of the three vessels are listed in tables 15, 16, and 17. The common and scientific names of fish caught are listed in table 14.

Longline fishing

Routinely, 60 baskets of 11-hook longline fishing gear were set from the Manning at each fishing station; 38 stations were fished successfully. The gear used was of POFI design, as described by Mann (1955). Pacific herring (Clupea pallasi) was used for bait. The station data and catch per 100 hooks fished are presented in table 18; the catch record in numbers of fish is presented in table 19.

Live-bait fishing

Fishing trials with live-bait were made from the Gilbert on 103 surface tuna schools in the Marquesas and Tuamotus. The Marquesan sardine and goatfish were used as bait. Of the total catch of 4,838 skipjack and 52 yellowfin, 797 skipjack and 10 yellowfin were marked with the POFI type D-2 tag and released, all in the Marquesas area. The station data, catches, and bait used are listed in table 20. The live-bait fishing techniques for surface schools were similar to the techniques of the Hawaiian skipjack fishery, as described by June (1951).

Baitfish surveys

Two procedures were used for conducting baitfish surveys in the Marquesas; day visual scouting and night-light fishing. Visual scouting during the day was done by three or four swimmers, equipped with faceplates, making a "sweep" of the shallow water in the bays and noting the schools of bait-sized fish. Night-light fishing was done with the Gilbert anchored in about 40 feet of water. Marquesan sardines of all sizes were attracted to the diffused light from a floodlight, and the fish were caught alongside the vessel using a "night net" of specialized design. Results of visual scouting, day fishing, and night-light fishing are presented in table 21.

Biological observations

Routinely, the fork length of representative samples of the tunas and bait species was taken and recorded. Station data and length frequency summaries of catches made from both the Gilbert and Manning are presented in tables 22 through 28, inclusive.

During daylight hours on all three vessels, a watch was kept for birds, tuna schools, and aquatic mammals. Summaries of these observations are presented in tables 29 through 32, inclusive.

LABORATORY PROCEDURES

Oceanographic data

The salinity samples were analyzed by the Fajans modification of the Mohr method (Van Landingham 1957). The inorganic phosphate samples were analyzed by the hydrazine sulphate modification of Denige's method (King et al. 1957).

The oceanographic station data were processed by the use of techniques described by Montgomery (1954), Montgomery and Wooster (1954), Stroup (1954), and King et al. (1957). The curves for each station are included in table 1.

Rate of carbon fixation

A detailed description of laboratory procedures for the determination of the amount of C^{14} photosynthetically fixed per unit of time and associated calculations has been given by King et al. (1957). The counting, using a Tracerlab SC16 windowless gas flow counter and a Tracerlab 1000 Scaler or a Nuclear Chicago 161A Scaler, was done at the University of Hawaii, Department of Botany. The results of these measurements are given in table 11.

Zooplankton

The displacement volumes of the plankton collected on oblique and surface tows made from the Smith and the surface tows made from the Gilbert are given in tables 12 and 13. These volumes were determined after removing all fish eggs and larvae, as well as all "jellies" greater than 2 cm. in length. The details of the method are described by Hida and King (1955).

NOTES ON OCEANOGRAPHIC STATION CURVES

Thermometric anomaly (oblique lines) are in centiliters per ton (see Mongtomgery 1954). Where temperatures of paired thermometers differed by more than 0.05°C. below 300 m. or more than 0.10°C. above 300 m., both values are plotted and designated by the symbol $\Delta\Delta$. The other variables are plotted for each of the temperature values, see station O-1. When the station curve is not drawn through a plotted value, it is considered a gross error and not used.

Explanatory code for station curves

- ▲ Reversing thermometer temperatures °C.
- BT temperature °C.
- Salinity ‰
- ▽ Dissolved oxygen ml./L.
- ◎ Inorganic phosphate $\mu\text{g at.}/\text{L}$.

NOTES ON OBSERVED OCEANOGRAPHIC DATA

Where more than one cast was made on a station, they are separated by a horizontal line. The cast number is indicated by a Roman numeral in the margin.

Where the corrected, paired, protected thermometer readings differed by more than 0.05°C. below 300 m. or more than 0.10°C. above 300 m., both temperature values are tabulated and the depth and salinity are repeated. Delta-t calculated using each temperature value is carried.

The following oceanographic stations were pretrips. Surface temperature and salinity for these stations will be found in table 2.

Station No.	Latitude	Longitude	PO ₄ , $\mu\text{g at.}/\text{L}$.	BT No.
38	17°40.0'S	136°16.0'W	0.29	193
39	17°31.0'S	138°10.0'W	0.29	197
52	01°46.0'S	144°53.6'W	NG	241

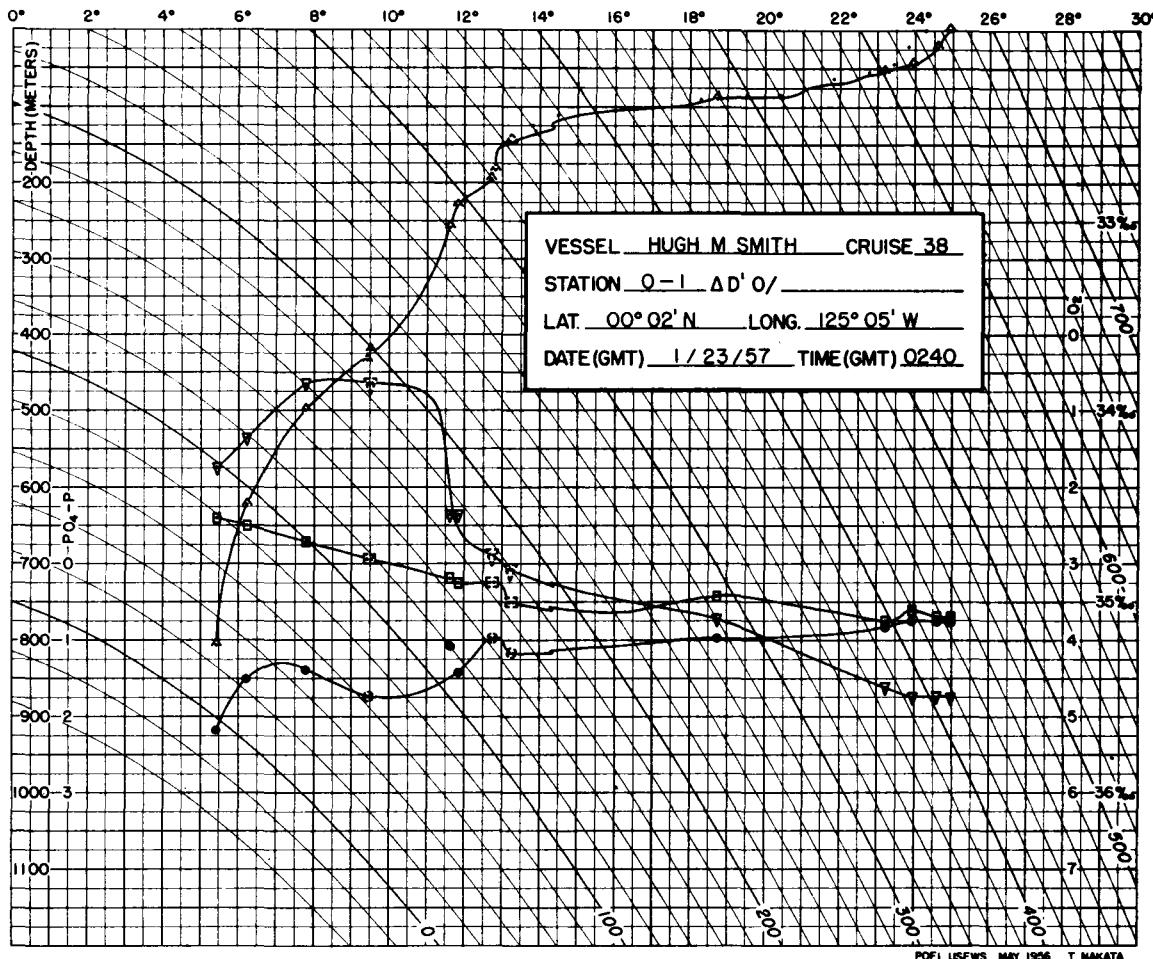

Wind velocity was measured with an anemometer 30 meters above the sea surface. The direction (given to the nearest 10°) is that from which the wind was blowing, measured through 360° from north.

Oxygen samples on station O-25 were improperly labeled in the field and have been arranged according to the station curves on either side of the station. Oxygen samples were not taken while the vessel was drifting (stations O-14 through O-23).

Phosphate values on stations O-14 through O-23 were deleted as examination indicated they were erroneous. Stations O-46, O-47, and O-49 appeared questionable but were retained for information.

Explanatory code for tabulated data

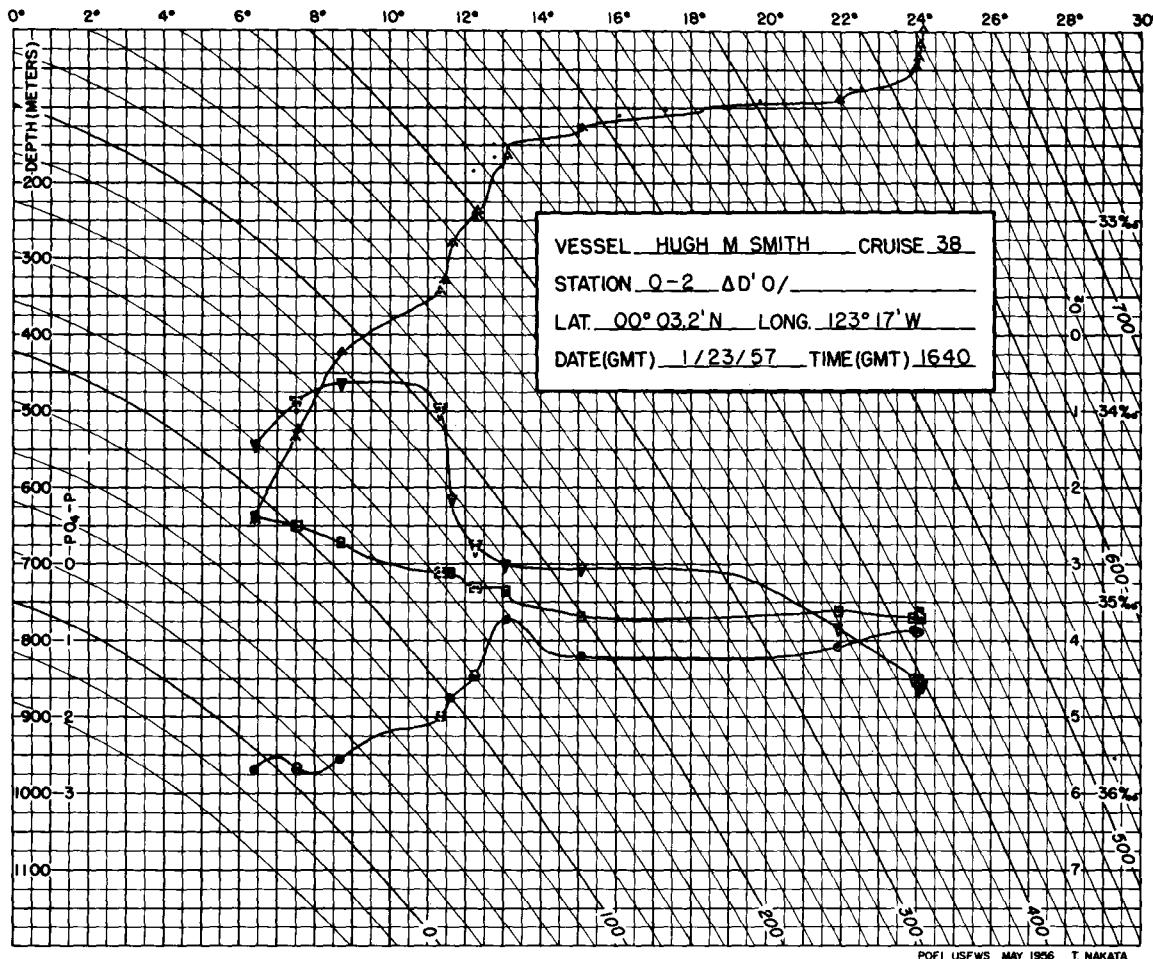

- NC - The value or line is in error and is discarded.
- NS - This water sample was lost.
- PT - Nansen bottle pretripped and data are unusable.
- Q - The value seems questionable but was used in construction of the station curve.
- P - The value is questionable and while carried was not used in drawing the station curve.

1/ All fish, jellies >2 cm. and organisms >5 cm. are not included.

Table 14.--Common and scientific names of fish caught

Yellowfin tuna	<u>Neothunnus macropterus</u> (Temminck and Schlegel)
Bigeye tuna	<u>Parathunnus sibi</u> (Temminck and Schlegel)
Albacore	<u>Germo alalunga</u> (Bonnaterre)
Skipjack	<u>Katsuwonus pelamis</u> (Linnaeus)
Little tuna	<u>Euthynnus yaito</u> Kishinouye
Dogtooth tuna	<u>Gymnosarda nuda</u> (Günther)
Dolphin	<u>Coryphaena hippurus</u> Linnaeus
Shortnosed spearfish	<u>Tetrapturus angustirostris</u> Tanaka
White marlin	<u>Istiomax marlina</u> (Jordan and Hill)
Black marlin	<u>Makaira ampla</u> (Poey)
Striped marlin	<u>Makaira audax</u> (Philippi)
Wahoo	<u>Acanthocybium solandri</u> (Cuvier and Valenciennes)
Whitetip shark	<u>Pterolamiops longimanus</u> (Poey)
Silky shark	<u>Eulamia floridanus</u> (Bigelow, Schroeder, and Springer)
Great blue shark	<u>Prionace glauca</u> (Linnaeus)
Bigeye thresher shark	<u>Alopias superciliosus</u> (Lowe)
Bonito shark	<u>Isurus glaucus</u> Müller and Henle
Hammerhead shark	<u>Sphyraena lewini</u> (Griffith)
Lancet fish	<u>Alepisaurus</u> sp.
Puffer	<u>Lagocephalus lagocephalus</u> (Linnaeus)
Marquesan sardine	<u>Harengula vittata</u> (Cuvier and Valenciennes)
Goatfish	<u>Upeneus parvus</u> Poey
Red snapper	<u>Lutjanus bohar</u> (Forskål)
Green snapper	<u>Aprion virescens</u> Cuvier and Valenciennes
Jack	<u>Caranx ignobilis</u> (Forskål)
Jack	<u>Caranx lugubris</u> Poey
Jack	<u>Caranx melampygus</u> Cuvier and Valenciennes
Barracuda	<u>Sphyraena nigripinnis</u> Temminck and Schlegel
