Bishop, Calif.

ABSTRACT

A series of tables give daily records, with monthly and annual means, of water temperature, air temperature, and stream flow for Convict Creek Experiment Station, Calif., from 1950 to 1962. The 13-year means were water temperature 47.6°F., air temperature 44.6°F., and stream flow 22.3 c.f.s.

Since rehabilitation of Convict Creek Experiment Station in 1950, continuous air and water temperatures and water flow records have been maintained. Records for the period 1950 through 1962 are presented and discussed here. We are indebted to the Department of Water and Power of the City of Los Angeles for the flow records.

Convict Creek Experiment Station is located at latitude 37° 37' N. and Longitude 118° 50' W. and lies within the Inyo National Forest on the eastern escarpment of the Sierra Nevada, in Long Valley, Mono County, Calif. The Station is 35 miles northwest of Bishop, Inyo County, Calif., at an elevation of 7,200 feet above sea level (fig. 1).

A general description of this immediate area, as well as a brief summary of the geological history and the physical, chemical, and biological characteristics of the lakes in Convict Creek Basin, has been given in several unit reports as well as in a general report based on these separate studies (Reimers, Maciolek, and Pister, 1955). The objectives, facilities, and operational procedures of Convict Creek Experiment Station have been described by Nielson, Reimers, and Kennedy (1957).

The climate of the eastern slope of the Sierra Nevada is extremely variable and is similar to that of other western mountain areas which lie leeward of high mountain ranges, with respect to prevailing westerly winds and Pacific storm systems.

The summer season in this area is short and extremely dry (humidity averages about 15 percent) though occasional thunderstorms occur during the late afternoon and evening hours of the hottest days. July and August are usually the only frost-free months, and July is normally the warmest month of the year. Figure 2 shows an early summer scene and the type terrain surrounding the Station.

Figure 1:--Vicinity map of Convict Creek and surrounding area.  
(From Mount Morrison and Casa Diablo Quadrangles, 1953).

Figure 2--Convict Creek Experiment Station, looking West. Early summer of 1961. Crest of Sierra Nevada in background.

Figure 3--Convict Creek Experiment Station, looking northeast. Early spring of 1952, snow depth about seven feet.

Autumn months are the most pleasant as the "Pacific highs" infiltrate this area with slight breezes, blue smogless sky, and warm daytime temperatures. Below-freezing temperatures (as low as 10° F.) are common in the early morning hours.

Winter is characterized by moderate snow-fall with average depths of 2 to 4 feet. Subfreezing temperatures prevail, and strong, gusty winds are common. These winds usually precede and follow low-pressure systems swinging southeasterly across northern and central California. The lakes in this general area and elevation, 7,000 feet, usually freeze over by mid-December, and the streams are almost hidden by drifting snow. January is normally the coldest month of the year. Figure 3 shows a severe winter scene at Convict Creek Station.

At this elevation, the spring season is characterized by unsettled weather with snowstorms, rain, sleet, subfreezing temperatures, and gusty winds. Spring thaw begins in late March, and lakes and streams are usually open by late April. Daytime temperatures gradually climb to a comfortable level by June, but freezing temperatures may be expected during the early morning hours.

## EQUIPMENT AND METHODS

Air and water temperatures were taken with a recording thermograph with a range of 0 to 100° F., graduated in 1° intervals. Recorded temperatures were read to the nearest of 0.5° F. The thermograph was calibrated every 4 months with a resistance thermometer. Supplementary temperatures were taken with a maximum-minimum thermometer when the thermograph was inoperative and during low air temperature periods.

The flow-gaging station on Convict Creek, maintained by the Department of Water and Power of the City of Los Angeles, is located 1-1/2 miles below the outlet of Convict Lake and 1-1/2 miles above the upper boundary of the Station area. Initial installation was made on June 30, 1925, with flow records beginning on November 15, 1926.

Mean water temperatures for the 13-year period are shown in table 1 by months and by years, and for the entire period. Mean air temperatures are similarly tabulated in table 2, together with annual number of hours below 32° F. Mean flows are similarly shown in table 3 along with annual run-off in acre-feet.

Mean temperatures and flow data are presented in tables 4, 5, and 6 by months, monthly minima and maxima, semiannual, annual, and totals for the period.

Daily and mean monthly maximum and minimum water and air temperatures are presented for the 13-year period in tables 7 to 32, along with monthly means. Mean daily and monthly rate of flow and monthly volume of flow are shown in tables 33 to 45.

## DISCUSSION OF DATA

Temperature and flow data presented in this report are for the most part self-explanatory, but a general discussion of the data may be helpful.

As indicated in table 1, the 13-year mean water temperature was 47.6° F. The maximum annual mean was 49.9° F. (1958); the minimum annual mean was 44.7° F. (1952).

The 13-year mean air temperature (table 2) was 44.6° F., three degrees lower than the 13-year mean water temperature (table 1). Maximum annual mean was 47.7° F. (1958); minimum annual mean was 40.7° F. (1952).

The 13-year mean of hours below 32° F. was 2,478; greatest number of hours below 32° F. was 3,438, in 1952; the least was 2,101 in 1958. There are 8,760 hours in a calendar year, except for leap years with 8,736. During this 13-year period, the leap years were 1952, 1956, and 1960. It can be stated that in this general area approximately a third of each year has below-freezing temperatures.

As indicated in table 3, the 13-year mean rate of flow was 22.3 c.f.s. Maximum annual mean flow recorded for the period was 34.9 c.f.s.

(1956; minimum flow was 11.1 c.f.s. (1961). The 13-year mean run-off was 16,219 acre feet. Maximum value of 25,378 acre feet was in 1956; the lowest, 8,027 acre feet, was in 1961.

The temperature and flow data in tables 4, 5, and 6 were formulated on a May through April basis and are presented in this manner for convenience in relation to the experimental fish testing program of the Station.

Figure 4 illustrates the general trend for the mean annual air and water temperatures for the 13-year period and clearly indicates the severity of the winter of 1951-52 with its extremely low air and water temperatures. A general but sharp rise in air and water temperature was evident between 1956 and 1960. From 1960 through 1962 temperatures had begun to decline to near average values.

Figure 5 shows the relation of mean monthly rate of flow to air and water temperatures, illustrated by maximum and minimum run-off years for the 13-year period. Even though the run-off was markedly different between the two years it is evident that snow melt is initiated and flow increases near the latter part of April when mean monthly air and water temperatures reach 40° F. Run-off usually peaks in late June and decreases sharply through the months of July and August. Flow begins to level off during September, at which time cooler temperatures at the higher elevations prevent any further snow melt and the flow stabilizes at a low level (unless unusual weather conditions prevail) until the following spring. Convict Creek is like other small lotic situations in that the water temperature closely parallels the air temperature.

The maximum air temperature recorded in the 13-year period was 94° F. on June 20, 1961; minimum air temperature recorded was -22.0° F. on January 4, 1955; maximum water temperature recorded was 74° F. on August 11, 1960; minimum water temperatures of 32° F. are recorded every year during the winter and early spring months.

Maximum rate of flow recorded in the 13-year period was 183.9 c.f.s. on June 25, 1958;

minimum rate of flow recorded was 1.3 c.f.s. on January 10, 1951. In the 35 years the meter station has been in operation the maximum flow recorded was 234 c.f.s. on June 29, 1932; minimum flow recorded was 1.3 c.f.s. on January 10, 1951.

Extreme variation in temperature and precipitation was evident during this 13-year period. The winter of 1951-52 was by far the most severe, with snow depths between 5 and 15 feet (fig. 3), gusty winds to 80 m.p.h., and below-normal temperatures. U.S. Highway 395 was closed periodically throughout this winter. During the latter half of December 1955 a large Pacific warm front originating east of Hawaii failed to follow the normal pattern of moving in a north-eastern direction and swung due east, inundating this area with heavy rain that lasted for 36 hours and eventually turned into heavy, wet snow which continued for another 48 hours. Flooding was extensive, and sleet and snow snapped power and telephone lines and even toppled power poles. The winters of 1959-60 and 1960-61 were relatively mild with below-normal precipitation. Although the long-range forecast for the winter of 1961-62 was for a continued pattern of below normal precipitation, between February 7 and February 14, 1962, a persistent low-pressure system dumped 53 inches of snow in the immediate area. This situation was paralleled in February 1963 except that heavy amounts of rain followed the heavy snowfall and reduced the snowpack to one-fourth its original depth, and flooding was common throughout the area.

Precipitation was measured during 1 year, October 1, 1957, through September 30, 1958, by means of a standard Weather Bureau type 8-inch rain gage. A total of 17.4 inches of precipitation was measured which included approximately 200 inches of snow with a water content of 11.2 inches. Rain made up the rest of the precipitation, 6.2 inches, and was primarily from thunderstorms. The first snowfall of this period was on October 20, 1957, and the last on April 7, 1958. Heaviest snowfall recorded was 26 inches (water content of 2.75 inches) on March 15 and 16, 1958. Heaviest rainfall, amounting to only 0.35 inches, was recorded on August 18, 1958. This was probably an average year of precipitation.

The United States Department of the Interior, created in 1849, is concerned with management, conservation, and development of the Nation's water, wildlife, fish, mineral, forest, and park and recreational resources. It has major responsibilities also for Indian and Territorial affairs.

As America's principal conservation agency, the Department works to assure that nonrenewable resources are developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States, now and in the future.

UNITED STATES DEPARTMENT OF THE INTERIOR

Stewart L. Udall, *Secretary*

Frank P. Briggs, *Assistant Secretary for Fish and Wildlife*

FISH AND WILDLIFE SERVICE

Clarence F. Pautzke, *Commissioner*

BUREAU OF SPORT FISHERIES AND WILDLIFE
