FISHERY STATISTICS
OF THE UNITED STATES
1960

BY
E. A. POWER

PUBLISHED BY BUREAU OF COMMERCIAL FISHERIES • WASHINGTON • 1962
PRINTED AT U.S. GOVERNMENT PRINTING OFFICE, WASHINGTON

"Fishery Statistics of the United States" are compiled and published annually to make available information on both the economic and biological aspects of the domestic commercial fisheries.

Data on the economic aspects are necessary to persons engaged in the commercial fishery and to governmental agencies concerned with its regulation and protection. Those here given cover the total catch and value by species, the yield and value of manufactured products and byproducts, the employment of men, craft, and gear in the capture of fishery products; and related information.

From the biological standpoint these data are important to sound fishery management in providing detailed information on fluctuations in the commercial catch by species, locality, and gear, and type of craft operated. They assist conservation agencies in regulating the commercial fisheries so as to produce maximum yields without depletion.

Previous statistical reports on the fishery industries were issued under the Department of the Interior in the Administrative Report series for 1938 and in the Statistical Digest series for succeeding years. Reports for preceding years were issued in the Administrative Report series of the former Bureau of Fisheries.

The following is a listing of the various editions of "Fishery Statistics of the United States" issued since 1939:

Statistical Digest Number	Title
No. 1	Fishery Statistics of the United States, 1939
4	Fishery Statistics of the United States, 1940

ACKNOWLEDGMENTS

The data in this edition of "Fishery Statistics of the United States" were collected, tabulated, and prepared for publication by the staff of the Branch of Statistics under the direction of E. A. Power and Charles H. Lyles, assisted by Stacey C. Denham. Compilation of this report was under the supervision of Francis Riley. Field surveys were supervised by the various Regional and Area offices. Project leaders in charge of field surveys were: Dwight L. Hoy, New England, Middle Atlantic, and Chesapeake States; George W. Snow, South Atlantic and Gulf States; Victor J. Samson, California; Charles M. Reardon, Washington and Oregon; William K. Evans, Alaska; Robert G. Personius, the Great Lakes and Mississippi River States; and Thomas S. Hida, Hawaii.

The cooperation of the many contributors is gratefully acknowledged. Cooperators are given credit for their information in the section of the report in which the data appear.

PREFACE

This report contains a review of the fishery statistics for the year 1960 collected during 1960 and 1961 by the Branch of Statistics, Division of Resource Development. These statistics include data on the volume and value of the catch of fishery products, employment in the fisheries, quantity of gear operated, number of fishing craft employed in the capture of fishery products, and information on the volume and value of the production of manufactured fishery products and byproducts.

In assembling the data on the fisheries, all appropriate records collected by the various State fishery agencies were used. In certain areas, information complete enough to be used by the statistical agents was available from State agencies, and in these States only partial surveys were conducted. Information on the means of collecting the data and an explanation of terms used may be found in Section 13 of this publication. Statistics on the imports and exports of fishery products were furnished by the Bureau of the Census.

Complete statistical surveys covering the fisheries of the United States were conducted in all areas for 1960 except for wholesale data for some of the lower Mississippi River States. Section 13 of this publication contains a chart indicating the areas for which statistical surveys have been conducted from 1880 to 1960. The first complete survey of the fisheries of the United States was made by the Bureau of the Census for 1908. Others were made by the Bureau of Fisheries and the Wildlife Service for the years 1931, 1950, and for the years 1954 to 1960 inclusive.

To assist persons interested in reviewing historical statistics of the domestic fisheries, a bibliography was published in "Fishery Statistics of the United States, 1956," listing the sources of data on the fisheries of the various regions of the United States for the years from 1880 to 1956.

SECTION 1 - GENERAL REVIEW

The 1960 commercial fisheries of the United States yielded a catch of 4.9 billion pounds valued at \$353.6 million to the fishermen. Only in 1956, when a record 5.3 billion pounds were taken, and in 1959 (5.1 billion pounds) was the annual harvest greater. Compared with 1959, the catch was down 180 million pounds or 4 percent while the value was up over \$7 million or 2 percent. The average price paid to fishermen in 1960 was 7.2¢ per pound--a little higher than in the previous year.

Sharp declines in landings of menhaden, Alaska herring, Pacific sardines, squid, and miscellaneous species used in the manufacture of industrial products resulted in the reduced volume. Increases occurred in catches of Pacific salmon, yellowfin tuna, jack mackerel, crabs, and Maine herring.

The 1960 catch was taken by 130,431 fishermen. Of this total, nearly 42,000 (32 percent) were employed on vessels. A total of 12,018 vessels of 5 net tons and over, 56,889 motor boats, and 8,150 other craft engaged in commercial fishing during the year. Over 2,000 persons were employed on 1,094 transporting craft. There were 4,207 wholesaling and manufacturing plants in the United States, which employed 93,625 persons. Fishermen engaged in processing their catches into manufactured products numbered 853.

Menhaden continued to rank first in volume--a position it has held continuously since 1946. The catch of 2 billion pounds--41 percent of the total United States production of all species of fish and shellfish, etc.--was 184 million pounds less than in 1959; however, it was the third largest catch in the history of the fishery.

The increase in the catch of menhaden in the Gulf States resulted in a record catch of 841 million pounds from the Gulf of Mexico. Fish were there in volume and in areas where they could be easily taken. Along the Atlantic Coast, the catch was less than in 1959, mainly because of reduced catches off Virginia and North Carolina. Because of a drastic reduction in the number of vessels operating in the fall fishery and severe weather conditions during the month of December, large numbers of good size fish were left undisturbed as they passed along the South Atlantic Coast late in the year.

The price of menhaden meal and solubles dropped sharply in 1959 and in 1960 the market was weak and inventories were high. Manufacturers had little incentive to produce although menhaden were abundant in most areas in 1960. Fewer vessels operated, and in some areas limits were imposed on the volume landed. Some factories did not begin producing until late in the season and at least one plant suspended operations for a month in midseason.

In 1960, the Pacific Coast tuna fishery recovered from the chaotic conditions of the previous year. Landings totaled 288 million pounds--20 million pounds more than in 1959. Outstanding in the economic recovery of the tuna fishery was the spectacular success of clippers converted to seiners. Tuna seiners were more efficient and economical, taking larger catches in less than one-half the time required by tuna clippers. The converted vessels made trips averaging 4 to 6 weeks, while in past years, as clippers, they were at sea for 10 to 14 weeks. Their success was reflected in reduced operating costs which permitted the fish to be sold at lower but profitable prices. Albacore fishing off the Coasts of Oregon and Washington in 1960 was only 37 percent as productive as in 1959. Landings dropped sharply from 14 million pounds in 1959 to about 5 million pounds in 1960. In California, the albacore catch (35 million pounds) was up 7 percent.

Tuna canners were better off in 1960 than in 1959. There were few price disputes, labor difficulties, or fleet tieups. A good supply of prime domestic tuna (mostly yellowfin) was available at lower prices, creating an increased demand for domestic fish. Imports of frozen tuna, loins and discs, and canned tuna were less than in 1959. The United States consumption of canned tuna, stimulated by intensive advertising and promotion, continued to grow, reaching about 2 pounds per capita--an increase of approximately 100 percent in the last decade. The 1960 United States pack reached a record 15.3 million cases valued at \$173 million.

Shrimp continued to yield more revenue to United States fishermen than any other species. The catch amounted to 249 million pounds, with an ex-vessel value of nearly \$67 million. The volume was up 9 million pounds and the value \$9 million compared with the previous year. Larger catches were registered in the Sanibel-Tortugas area, along the Texas Coast, off the Louisiana Coast, and in the Campeche area. However, catches off the Texas Coast, the Apalachicola area, and off the Louisiana Coast were made with greatly increased effort. Fishing effort on the high seas off the Mexican Coast west of 94° declined. Despite increased catches during 1960, the industry was still greatly concerned over the continuing rise in imports which totaled a record 113 million pounds. Primarily through the National Shrimp Congress, the industry continued its effort to have legislation enacted that would provide for an orderly flow of imports.

The processing of shrimp to such end-use products as peeled and deveined, frozen raw headless, breaded, and canned continued to increase during 1960. Among the unusual developments during the year was the introduction of a grading machine aboard a trawler operating out of Brownsville, Texas, to provide an easy method of handling small size shrimp aboard the vessel. In addition, several of the vessels experimented with three trawls.

The catch of Pacific Coast shrimp was down sharply in 1960. Landings totaled only 12 million pounds--8 million pounds less than in 1959. The 1960 Pacific Coast shrimp pack totaled only 79,000 cases, less than half the 169,000 cases packed the previous year. It was evident that markets other than those for the canned product were needed. The frozen market might be able to absorb the potential production if processors could be assured of a steady supply of raw material in large volume at stable prices.

The 1960 catch of sea herring, the fourth ranking item in the United States fisheries, amounted to 239 million pounds--about 3 million pounds more than in 1959. On the Atlantic Coast, the catch of 155 million pounds was 28 percent greater than in 1959. Over 98 percent (152 million pounds) was landed in Maine--about 35 million pounds more than in 1959. Imports into Maine from Canada totaled 74 million pounds--10 million pounds more than in the previous year. Fishing was poor in June and July, but improved in late summer. Most of the domestically caught and imported Atlantic sea herring was used to pack sardines or pet food. Marketable size fish comprised the bulk of the catch. Pacific Coast landings of sea herring, taken mostly in Alaska for manufacture into meal and oil, amounted to 84 million pounds--31 million pounds or 27 percent less than the previous year.

The depressed condition of the world market for fish meal was reflected in the Pacific Coast herring fishery. Although the 1960 catch was lower and prices paid to fishermen were less than in 1959, the domestic industry fared better than in neighboring British Columbia, where the fishery was crippled by price disputes and fleet tieups.

The 1960 Pacific salmon catch totaled 235 million pounds valued at \$45 million--much better than in 1959 when 202 million pounds valued at \$36 million were landed. However, only in Western and Central Alaska was the season really successful. In some areas, the fishery was nearly a failure. Alaska's catch (207 million pounds valued at \$34 million) was up 41 percent in volume and 60 percent in value. In Oregon, production was about the same as in the previous year. Washington and California landings were well below those of 1959. The 1960 pack of canned salmon increased to 2.8 million cases from 2.5 million cases in 1959. Alaska showed a gain of 793,000 cases while the pack in Washington, Oregon, and California was down 424,000 cases.

Red salmon returned to Bristol Bay, Alaska, in near record numbers in 1960. The total run, estimated at well over 35 million fish, yielded a catch of about 13.5 million fish, of which almost 10 million were taken in the Naknek-Kvichak area. Over 20 million fish (perhaps a new record) escaped capture and reached spawning grounds. One major factor for the exceptionally large escapement was the small size of the fish (4.8 pounds average). At times during the season, catches were too large for canneries to handle. Limits were set and fishing ceased until cannery crews caught up.

GENERAL REVIEW

Combined Atlantic groundfish landings (cod, cusk, haddock, hake, pollock, and ocean perch) amounted to 330 million pounds valued at \$19 million. Compared with 1959, the volume landed was up about 3 million pounds while the value received by fishermen declined about \$3 million. Average prices paid to fishermen were approximately 13 percent below the previous year's level. Cod and pollock catches were less while haddock and ocean perch showed gains. The heavier haddock landings in 1960 were due to a good scrod catch in contrast to landings of large haddock which declined. With little interruption, there has been a steady downward trend in the catch of large haddock from 1938 through 1960. The area's ocean perch fishery recovered slightly from the 1959 low. The fleet operated at capacity. More trips were completed with fewer vessels. Gloucester trawlers turned more toward the Nova Scotia banks in 1960 and away from distant Gulf of St. Lawrence banks which had supplied a large part of the catch through most of the 1950's.

The domestic production of groundfish fillets amounted to 93.8 million pounds--slightly above the 91.1 million pounds produced in 1959, but nearly 55 million pounds less than the 148.8-million-pound peak production of 1951. In 1960, the total supply of groundfish fillets (domestic production plus imports) amounted to 249 million pounds. Only 38 percent of the supply came from domestically caught fish. The remainder was imported principally from Canada and Iceland. New England continued as the leading producing area for frozen fish sticks and portions. Cooked fish dinners (mostly haddock and cod prepared from frozen fish blocks) became an important item in the speciality field. The increased activity in shore plants did not, however, affect the domestic catch of groundfish since requirements were met chiefly from imports of frozen blocks of groundfish fillets.

The 1960 halibut fishery of the United States and Canada in the northeastern Pacific Ocean and Bering Sea yielded a record catch of 71.9 million pounds (landed weight). United States fishermen took 38.3 million pounds or 53 percent of the total. Canada continued to increase its share and took the largest catch in the history of its participation in the fishery. There was a decrease in production from Areas 3A and 3B in spite of a larger fleet, while more fish were taken from Areas 2A, 2B, and 2C with a smaller fleet. To westward (Bering Sea), the decline was due chiefly to poorer fishing. There was an increase in landings of American fish at Prince Rupert, British Columbia. Halibut prices paid to fishermen in 1960 were below those of the previous year.

The 1960 catch of jack mackerel (75 million pounds) was 37 million pounds greater than in 1959. Pacific mackerel (37 million pounds) was taken in about the same amounts as in the previous year. Lacking sardines in consistent quantity during the fall months of the year, seiners took substantial quantities of mackerel.

Once again, the California sardine season was a failure. The catch dropped from 74 million pounds in 1959 to only 58 million pounds in 1960--the fourth smallest catch since 1915. There was no lack of interest in fishing, and weather did not limit activities. Sardines just failed to appear in appreciable quantities. High surface water temperatures were believed, at least partially, to be the cause of poor showings of sardines during most of the season. Only a few thousand cases of sardines were packed in San Francisco, and most of the fish canned in Monterey were trucked from southern ports.

Landings of anchovies were down from 7 million pounds in 1959 to 5 million pounds in 1960. The pack for human food, canned primarily for export, was larger than in 1959, but the second smallest since 1949. Due to the anchovies' small size and soft texture, it is difficult and costly to produce a good pack. A further problem was that other countries could pack anchovies less expensively. The catch of anchovies could be greatly increased if a better market demand were developed.

Landings of otter trawl industrial fish at New England ports fell from 152 million pounds in 1959 to only 34 million pounds in 1960. In the years since World War II, landings of these items for producers of fish meal, oil, and animal foods had become an important part of the New England fishing economy. However, the industry was adversely affected by a combination of factors which began in 1959. In that year, production of fish meal and solubles was heavy, and imports of these

products reached the highest level since 1954. Hog and poultry farmers experienced depressed conditions owing to falling prices for their products. Since the farmers were the principal users of fish meal and solubles, high supply was coupled with sluggish demand. Inventories rose, and prices fell for both domestic and imported products.

The problems of marketing fish meal and oil continued into 1960, and operations of New England industrial fishing craft and processing plants were curtailed. Plants closed, and one plant was dismantled. The lighter landings and lower ex-vessel prices caused a \$1 million drop in ex-vessel payments for industrial fish. The decline in these landings was the principal reason for the total New England catch's falling to the lowest level since 1947.

The 1960 catch of crabs amounted to a record 222 million pounds valued at over \$17 million to the fishermen. Compared with 1959, this was an increase of 47 million pounds or 27 percent in volume and \$2.3 million or 15 percent in value. The Chesapeake States (70.7 million pounds) led all areas in the production of crabs, accounting for 32 percent of the volume and 27 percent of the value. The Pacific Coast States led in the value of the catch with 65 million pounds (29 percent) valued at \$7.6 million (45 percent).

Dungeness crab landings totaled 36 million pounds--2 percent less than in 1959. In Alaska, there was a large expansion of the fishery for king crabs. Catches increased to 29 million pounds--10 million pounds more than in 1959. The canned pack increased by an astonishing 81 percent (1959--55,316 cases; 1960--100,105 cases).

The 1960 blue crab catch (155 million pounds valued at \$9.2 million) was 38 million pounds and \$1.1 million greater than in the previous year. Production was up in the Chesapeake, South Atlantic, and Gulf areas. The Chesapeake harvest was unusual in that there was an acute shortage of crabs during the first 6 months of the year, which resulted in a light supply and high prices during that period. Processors were less affected than the fishermen by the shortage since they augmented supplies by importing considerable quantities from areas as far south as Florida. As scientists had predicted, the shortage ended in midsummer, and in late July and during the remaining months of the year, fishermen took large catches which oversupplied the market and prices declined.

The 1960 production of oysters was the smallest in over 100 years. The catch of 60 million pounds of meats valued at \$29 million was 7 percent less than in the previous year. There was an increase in the production from the South Atlantic and Gulf States. However, it was insufficient to overcome the drastic decline in the Middle Atlantic and Chesapeake areas. The catch on the Pacific Coast was about 1 million pounds less than in 1959. The serious condition of the Middle Atlantic and Chesapeake oyster fishery continued to be of major concern to the industry. Disastrous mortalities virtually wiped out the industry in Delaware Bay and some New Jersey waters. Serious losses also occurred in the Chincoteague Bay area. There were indications that oysters were also threatened in other areas. *Dermocystidium*, predators, oxygen deficiencies, poor setting of seed, etc., contributed to the decreased production of oysters.

The Chesapeake Bay area accounted for 45 percent of the total volume and 66 percent of the value of the 1960 harvest of oyster meats. The Gulf States accounted for 27 percent of the volume but only 15 percent of the value. The Pacific Coast accounted for 18 percent of the volume and 8 percent of the total value.

A total of 271 whales was taken in 1960 by five catcher vessels operated by two whaling stations located in San Francisco Bay. This was a few less than were taken in 1959. Whale products, amounting to 10.3 million pounds, were manufactured from the catch. Both whaling companies operated primarily to obtain whale meat. Much of this was ground, packed in 50-pound bags, and frozen for sale to mink ranchers. Large amounts were also sold for use in canned pet foods. Due to a steadily increasing demand, the price of meat remained high. An additional plant licensed to operate a station at the mouth of the Columbia River was not active during the 1960 season.

GENERAL REVIEW

The following table represents recorded production for the areas in which surveys were made for the years shown and estimates for other regions. Data have been collected on the catch in all areas for the years following 1953.

UNITED STATES CATCH, 1946 - 1960

Year	Quantity	Value to fishermen	Average price per pound
	<u>Million pounds</u>	<u>Million dollars</u>	<u>Cents</u>
1946	4,467	313	7.01
1947	4,349	312	7.16
1948	4,513	371	8.22
1949	4,804	343	7.13
1950	4,901	347	7.09
1951	4,433	365	8.23
1952	4,432	364	8.20
1953	4,487	356	7.94
1954	4,762	359	7.55
1955	4,809	339	7.05
1956	5,268	372	7.06
1957	4,789	354	7.39
1958	4,747	373	7.86
1959	5,122	346	6.76
1960	4,942	354	7.15

San Pedro, California, was the leading fish landing port in the United States in 1960 with respect to both volume and ex-vessel value. Total landings in the San Pedro area, consisting largely of tuna, jack and Pacific mackerel, and sardines, amounted to 375 million pounds valued at nearly \$33 million. Pascagoula, Mississippi, a menhaden port, was in second place with landings of about 302 million pounds, followed by Lewes, Delaware, with landings of around 282 million pounds, chiefly menhaden. The menhaden ports of Empire and Cameron, Louisiana, were next with landings of 216 million pounds and 205 million pounds respectively. Gloucester, Massachusetts, was in sixth place with landings totaling 192 million pounds, consisting mainly of whiting, ocean perch, and industrial fish. New Bedford, Massachusetts, was in second place with respect to ex-vessel value of landings (over \$13 million), followed by Boston, Massachusetts (\$9.6 million), and Gloucester, Massachusetts (\$6 million). The predominance of high-priced sea scallops and flounders in the New Bedford receipts accounted for the high value, although the volume was much less than at other leading ports.

The catch of fish and shellfish used for human food (2.5 billion pounds) amounted to slightly more than one-half of the total 1960 production. The remainder (2.4 billion pounds) was manufactured into meal, solubles, and oil; used for bait; fed to fur-bearing animals and pets; and manufactured into shell buttons, etc.

It was estimated that the 1960 catch was marketed as follows: 1.6 billion pounds (round weight) as fresh and frozen, 1 billion pounds for canning, 82 million pounds for cured products, and 2.2 billion pounds for manufacture into industrial products. About 582 million pounds of waste from filleting, canning, and otherwise preparing fish for market were also used in the manufacture of industrial products.

The per capita consumption of fish and shellfish in the United States was 10.5 pounds (edible weight) during 1960--down somewhat from the previous year. Of this amount, fresh and frozen items accounted for 5.9 pounds; canned, 4 pounds; and cured, 0.6 pounds. Canned tuna was the principal item consumed, followed by groundfish in the form of fillets, sticks, and portions.

GENERAL REVIEW

The total pack of canned fishery products by 366 plants in the United States (including American Samoa and Puerto Rico) during 1960 amounted to 35 million cases (1.1 billion pounds), valued at \$388 million. Compared with the previous year, this was an increase of over 3 million cases (114 million pounds) and \$39 million. There was an increase in both the pack for human consumption and for animal food. Significant gains in the pack of animal food, tuna, salmon, and mackerel were primarily responsible for the overall increase. The value of three items--canned tuna, salmon, and animal food--accounted for 79 percent of the total revenue received by canners of fishery products.

The 1960 production of fishery byproducts was valued at nearly \$67 million--a decrease of \$15.6 million from the previous year, and the lowest value since 1945. The decrease was primarily caused by lower prices for fish meal brought on by record production and heavy imports in 1959. Fish meal and scrap totaled 580.3 million pounds with a value of \$25.3 million. This was a decrease of 32.8 million pounds and \$10.6 million from the 1959 production. Over 209 million pounds of marine animal oils, valued at over \$13 million, were produced in 1960. Compared with the previous year, this was an increase of 12 percent in quantity, but only 2 percent in value. The production of fish solubles and homogenized condensed fish amounted to about 198 million pounds with a value of \$4 million--a decrease of 132.9 million pounds and \$6 million compared with 1959.

The production of fresh and frozen packaged fish fillets and steaks in the United States during 1960 totaled 153.2 million pounds with a value of \$48.4 million to the initial processors. Compared with the previous year, this was an increase of 5.9 million pounds or 4 percent in volume and \$2.3 million or 5 percent in value. It was estimated that whole round fish weighing 453 million pounds were required for the 1960 production of packaged fillets and steaks.

Atlantic ocean perch fillets (43.6 million pounds) and haddock fillets (33.3 million pounds) were the leading items and accounted for 50 percent of the total volume and 43 percent of the total value. Other leading items filleted and steaked were flounders, cod, pollock, and halibut which made up 34 percent of the total quantity and 39 percent of the total value. The greatest production of packaged fish fillets occurred in the New England area which accounted for 70 percent of the volume and 61 percent of the value.

United States foreign trade in fishery products was valued at \$404 million during 1960. Imports for consumption accounted for \$360 million and exports, \$44 million. The value of fishery imports was \$6.4 million less than in 1959 while exports were down \$77,000. The principal items imported were fresh and frozen tuna, 241 million pounds; frozen groundfish fillets and blocks, 156 million pounds; and shrimp, principally frozen, 113 million pounds. Items received in considerably greater volume than in 1959 were fresh and frozen sea herring, albacore tuna, and shrimp. Sharp declines occurred in imports of fresh and frozen salmon, light meat tuna, groundfish fillets, and canned salmon and tuna. Exports of edible fishery products in 1960 totaled only 61 million pounds, probably the smallest volume for any year in the 20th century. Sharply reduced exports of canned salmon, sardines, and salted fish were largely responsible for the decline. In contrast to the low level of United States export trade in edible fishery products, nonedible items were valued at a record \$18.5 million. This resulted from near record exports of fish oils, and record shipments of fur seal furs and unmanufactured shells.

The 1960 production of frozen fish and shellfish by 280 domestic freezer and cold storage plants reporting to the Bureau of Commercial Fisheries totaled 328.7 million pounds. Of the total, 227.7 million pounds consisted of fish and 101 million pounds, shellfish. Leading products frozen were: shrimp, 91.8 million pounds; fish blocks, fillets, and steaks, consisting mostly of ocean perch and haddock, 51.5 million pounds; bait and animal food, 66.8 million pounds; headed and gutted whiting, 34.7 million pounds; and dressed halibut, 30 million pounds. These items accounted for 84 percent of the total freezings of fish and shellfish products. It was estimated that a catch of approximately 523 million pounds of fish and shellfish was needed to produce the 328.7 million pounds of round, dressed, and drawn fish, fish fillets, and packaged shellfish frozen in 1960.

GENERAL REVIEW

There were 432 vessels documented as fishing craft in 1960. Of this number, 408 were first documents and 24 were vessels previously removed from documentation.

Detailed summaries of the catch and operating unit data for the United States have been previously published in Current Fishery Statistics No. 2801. Summaries of operating unit and catch statistics for each region of the United States also have been previously published in the Current Fishery Statistics series of bulletins. Of importance also to those interested in the most recent fishery data available is the annual publication "Fisheries of the United States, A Preliminary Review," which is available in April of each year. It contains preliminary data on many aspects of the fisheries for the previous calendar year, with comparative data for previous years. This publication may be obtained free from the Office of Information, United States Fish and Wildlife Service, Washington 25, D. C.

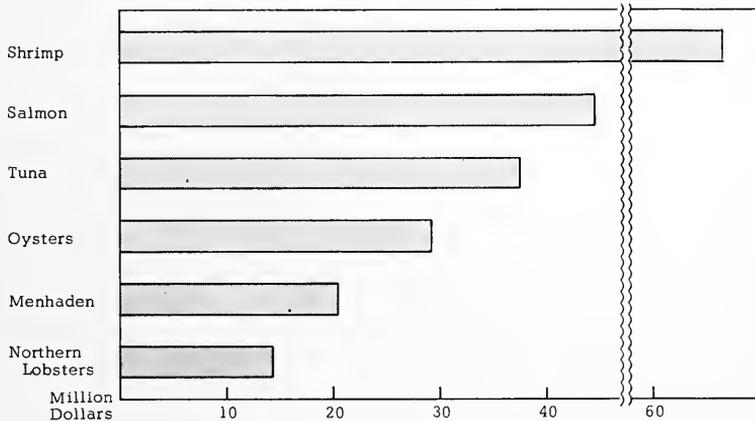

The current statistical publications of the Bureau which contain data on the domestic fisheries are listed in Fishery Leaflet 432 entitled "Fishery Statistical Publications of the Bureau of Commercial Fisheries." The publication also lists other Federal agencies, interstate commissions, and international and nongovernmental sources of fishery statistics. Copies of this leaflet may likewise be obtained free from the Office of Information.

UNITED STATES CATCH, 1960 - LIVE WEIGHT BASIS

In the annual summary bulletins, it is the practice of the Bureau to show the catch of univalve and bivalve mollusks on the basis of the weight of meats. Insofar as possible, all other fish and shellfish items are shown on a live weight basis.

Since world fishery statistics published by the Food and Agriculture Organization of the United Nations represent the live weight of the catch for all items of fish and shellfish, it has been necessary to provide that organization with information on the domestic catch of all species on a live weight basis. Data released by the Food and Agriculture Organization, therefore, indicate that the 1960 United States catch was 1.3 billion pounds greater than the figure appearing in Fish and Wildlife Service publications. The increase is due to the inclusion of the weight of the shells of univalve and bivalve mollusks in the Food and Agriculture Organization data.

It has been deemed desirable to include in this report a table showing the entire domestic catch on a live weight basis. Information is also published on the catch of fishery products in the principal countries of the world so that the relative importance of the domestic fisheries can be determined. Tables containing these data follow.

GENERAL REVIEW

WORLD CATCH OF FISH, CRUSTACEANS, MOLLUSKS, ETC., BY COUNTRIES, 1960

The 1960 world commercial catch of fish, crustaceans, mollusks, etc., totaled a record 83.2 billion pounds, according to the "Yearbook of Fishery Statistics, 1960" released by the Food and Agriculture Organization of the United Nations. The 1960 catch was 6 percent larger than in 1959 (78.5 billion pounds) and one third more than the 62.4 billion pounds landed in 1955. The 1960 catch was nearly double that in 1938 and 1948, just before and after World War II.

Five countries accounted for well over 50 percent of the 1960 world catch. Japan (16.4 percent) continued in first place, followed by China (Mainland) with 13.3 percent. Peru was in third place with 9.4 percent, then the U.S.S.R., (8.1 percent), and the United States (7.5 percent).

In 1956, the United States ranked second only to Japan as a fishing nation. In 1960, it followed not only Japan but also China (Mainland), Peru, and the U.S.S.R. While the United States catch has remained at about the same level since 1955, other countries have reported substantial increases. Peru's catch has risen phenomenally from only 470 million pounds to 7.8 billion pounds due chiefly to the development of the anchovy fishery. During the same 5-year period, Japan's catch increased from 10.8 billion pounds to 13.7 billion pounds; and U.S.S.R. reported an increase of a little over 1 billion pounds.

Asia, excluding the U.S.S.R., accounted for 43 percent of the world catch. Europe, excluding the U.S.S.R., accounted for 21 percent, followed by South America, 11.4 percent; North America, 10.8 percent; U.S.S.R., 8 percent; and Africa, 6 percent. The remaining catch was taken in Oceania.

About 40 percent of the world catch was marketed fresh. Reduction into meal and oil accounted for 20 percent; cured, 19 percent; canned and frozen, 9 percent each. The remaining 3 percent was used for miscellaneous purposes.

GENERAL REVIEW

MANUFACTURED FISHERY PRODUCTS

The 1960 production of manufactured fishery products (packaged, fresh and frozen; canned; cured; and byproducts) in the United States, American Samoa, and Puerto Rico was valued at \$813 million to the packers. This was \$61 million more than in the previous year. Canned products made up 48 percent of the total value; fresh and frozen packaged items, 39 percent; byproducts (principally meal, oil and solubles), 8 percent; and cured products, 5 percent.

The canned fish and shellfish pack in 1960 totaled 1.1 billion pounds valued at \$388 million. The pack for human consumption amounted to 666 million pounds valued at \$343 million; that canned for animal food and bait totaled 423 million pounds valued at \$45 million. The 1960 pack of tuna was greater than any other pack canned for human consumption and amounted to 15.3 million standard cases (301.4 million pounds), exceeding the record pack of 1959 by nearly 974,000 cases. The value of the tuna pack in 1960, amounting to \$173 million, was \$13.5 million more than in the previous year. The pack of canned salmon amounted to 2.8 million standard cases (136 million pounds) with a value of \$88.2 million--15 percent more in volume and 23 percent more in value than in 1959. The 1960 pack of Pacific sardines declined 138,700 cases in volume and \$740,500 in value from the previous year.

The production of fresh and frozen packaged fishery products in 1960 totaled 584 million pounds valued at about \$316 million. Compared with the previous year, the 1960 volume was up 11 percent and the value, 13 percent.

The 1960 production of fishery byproducts was valued at nearly \$67 million--a decrease of \$15.6 million from the previous year. Fish meal and scrap totaled 580.3 million pounds with a value of \$25.3 million. This was a decrease of 32.8 million pounds and \$10.6 million from the 1959 production. Over 209 million pounds of marine animal oils, valued at over \$13 million, were produced in 1960. Compared with the previous year, this was an increase of 12 percent in quantity but only 2 percent in value. The production of fish solubles and homogenized condensed fish amounted to about 198 million pounds with a value of \$4 million--a decrease of 132.9 million pounds in volume and \$6 million in value compared with 1959.

CANNED FISHERY PRODUCTS AND BYPRODUCTS

The total pack of canned fishery products by 366 plants in the United States including American Samoa and Puerto Rico during 1960 amounted to 35 million cases (1.1 billion pounds) valued at \$388 million. Compared with the previous year, this was an increase of over 3 million cases (114 million pounds) and \$39 million. There was an increase in both the pack for human consumption and for animal food. Significant gains in the pack of animal food, tuna, salmon, and mackerel were primarily responsible for the overall increase in 1960. The value of three items--canned tuna, salmon, and animal food--accounted for 79 percent of the total revenue received by canners of fishery products.

Primarily because of the lower prices for fish meal brought on by record production and heavy imports in 1959, the total value of byproducts produced in 1960 dropped to nearly \$67 million from a value of \$82 million during the previous year. The 1960 byproducts value was the lowest since 1945.

Tuna:--The 1960 pack of tuna amounted to 15.3 million cases, a new record. The pack was up 7 percent in volume and 9 percent in value compared with the previous year.

Salmon:--The 1960 pack of salmon amounted to 2.8 million cases valued at \$88.2 million. This represented an increase of 15 percent in volume and 23 percent in value. The increase in the Bristol Bay run of red salmon contributed chiefly to the increase. Failure of the runs elsewhere continued to plague the industry.

Mackerel:--The prevalence of these fish along the California coast, and the scarcity of sardines caused fishermen to devote more effort to this fishery during 1960. The pack of 935,000 cases was 59 percent greater in volume and 37 percent greater in value than in 1959.

Sardines:--The 1960 pack of Pacific sardines totaled 616,000 cases valued at \$4.7 million. Compared with the previous year, this was a decline of 18 percent in volume and 14 percent in value. Scarcity of sardines and the appearance of greater quantities of mackerel resulted in fishermen devoting more time to fishing mackerel, thus reducing the sardine catch and pack.

The Maine pack of sardines of approximately 2 million cases valued at \$16.7 million was up 14 percent in volume and 12 percent in value over the 1959 production. Landings of Maine herring, used principally for canning sardines, increased by approximately 30 percent or 35 million pounds, while imports increased by almost 10 million pounds.

Oysters:--The 1960 oyster pack totaling nearly 411,000 standard cases valued at \$5.6 million, was about 11 million cases and \$81,000 less than the previous year. With exception of 1958, the pack was the smallest since 1948. The 1960 production of oyster stew amounting to 122,000 cases was 15 percent less than the previous year.

Crabs:--The pack of crab meat amounting to 211,000 cases valued at \$5.5 million was the largest pack since 1948. The pack represented a 40 percent increase in volume and 54 percent increase in value over the previous year's production. The pack of Dungeness, king, and blue crabs increased during 1960.

Clams:--The pack of clam products in 1960 set a new record of 2.1 million cases valued at \$13.7 million. The pack represented a 5 percent increase in volume and a 3 percent increase in value over 1959. Continued expansion of the fishery along the Atlantic seaboard contributed chiefly to the increase.

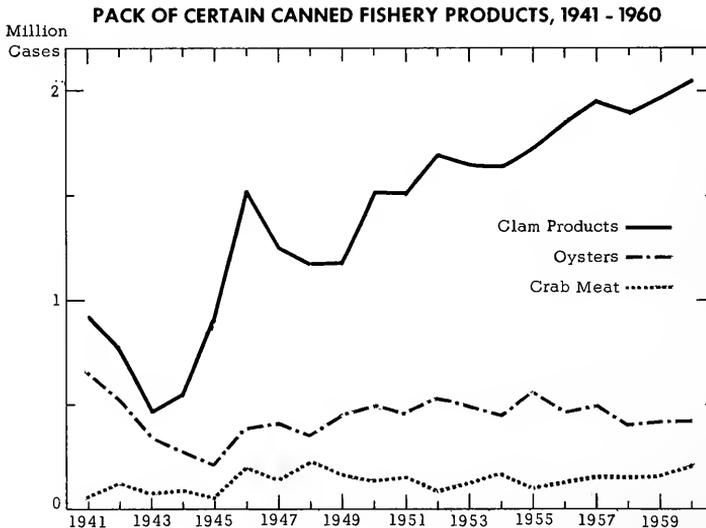

GENERAL REVIEW

Shrimp:--A total of 45 plants--33 in Louisiana, Mississippi, Alabama, and Texas; 1 in Georgia; and 11 in Alaska, Washington, and Oregon--packed 951,000 standard cases of shrimp valued at \$17.2 million in 1960. Compared with the previous year, this was an increase of 29,000 cases and \$284,000. A drop in the market value and the decreased demand for the small shrimp, which makes up the bulk of the West Coast pack, were responsible for the decline in the Pacific coast pack to 79,000 cases from the 1959 record pack of 169,000 cases. Canned shrimp production in the eastern and southern States was 16 percent greater than in 1959.

Animal Food:--A record pack totaling nearly 9 million standard cases valued at \$44 million was produced in 1960--over 1 million cases and \$2 million greater than the previous record year of 1958. Only canned animal food processed with 10 pounds or more of raw fishery products per standard case (48 one-pound cans) are considered in these data. Over 95 percent of the pack was produced in four States--Mississippi, California, Massachusetts and Maine. Whole fish in the amount of 116 million pounds, and waste fish, 95 million pounds, were used in the production of canned animal food.

Byproducts:--Fish meal production in 1960 totaled 290,000 tons, 16,000 tons less than the record year of 1959, and 6,000 tons less than the previous high in 1956. Because of the depressed market for fish meal in 1960 the price per ton was the lowest since 1945. Nearly 28 million gallons of fish and marine animal oil were produced in 1960, 2.9 million gallons more than the previous year and the highest annual production since 1944. The average value of the oil was 9 percent less than during 1959. Fish solubles and homogenized condensed fish production in 1960 totaled 99,000 tons, 66,000 tons less than in 1959.

Products from oyster shells, and buttons from fresh-water and marine mollusk shells produced in 1960 were valued at \$10 million. Other byproducts including agar-agar, glue, Irish moss extract, kelp products, liquid fertilizer, mollusk shell lime, etc., and pearl essence were valued at \$13.8 million.

PACKAGED FISH

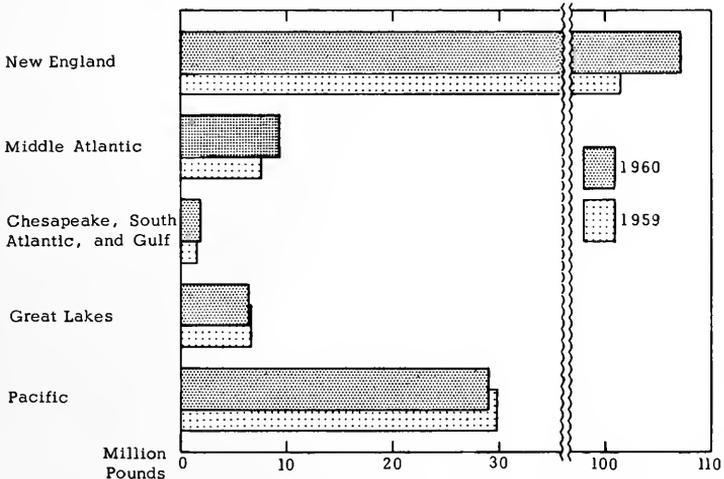

The production of fresh and frozen packaged fish fillets and steaks in the United States during 1960 totaled 153.2 million pounds with a value of \$48.4 million to the initial processors. Compared with the previous year, this represented an increase of 5.9 million pounds or 4 percent in volume and \$2.3 million or 5 percent in value. It was estimated that whole round fish weighing 453 million pounds were required for the 1960 production of packaged fillets and steaks.

Atlantic ocean perch fillets (43.6 million pounds) and haddock fillets (33.3 million pounds) were the leading items and accounted for 50 percent of the total volume and 43 percent of the total value. Other leading items filleted and steaked were flounders, cod, pollock, and halibut which made up 34 percent of the total quantity and 39 percent of the total value. The greatest production of packaged fish occurred in the New England area which accounted for 70 percent of the volume and 61 percent of the value.

Preliminary data on the production of packaged fish during 1960 have been previously published in Current Fishery Statistics No. 2542.

FROZEN FISHERY TRADE

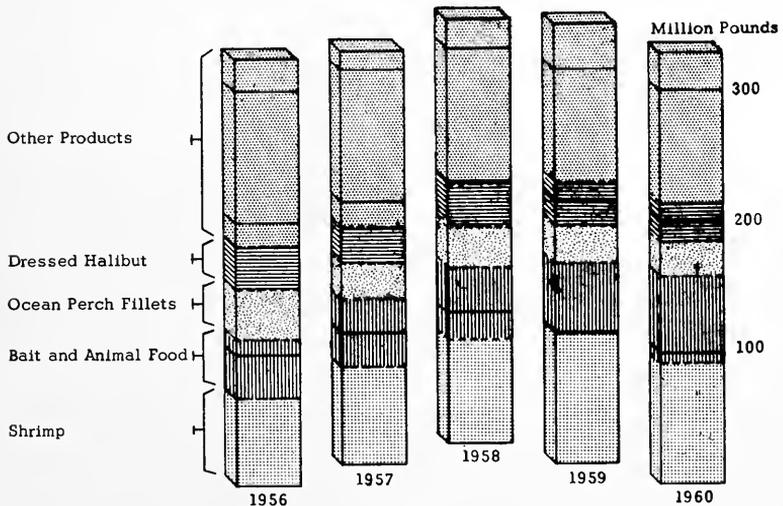

The 1960 production of frozen fish and shellfish by 280 domestic freezer and cold storage plants reporting to the Bureau of Commercial Fisheries totaled 328.7 million pounds. Leading products frozen were: shrimp, 91.8 million pounds; fish blocks, fillets and steaks, consisting mostly of ocean perch and haddock, 51.5 million pounds; bait and animal food, 66.8 million pounds; headed and gutted whiting, 34.7 million pounds; and dressed halibut, 30 million pounds. These items accounted for 84 percent of the total freezings of fish and shellfish products. It is estimated that a catch of approximately 523 million pounds of fish and shellfish was needed to produce the 328.7 million pounds of round, dressed, and drawn fish, fish fillets, and packaged shellfish frozen in 1960.

New England led all other areas in freezings with 144.9 million pounds or 44 percent of the total. The South Central area was in second place with 67.9 million pounds. The Pacific was third with 39.9 million pounds, followed by the South Atlantic area with 34.8 million pounds and Alaska with 29.9 million pounds. The Middle Atlantic, North Central East, and North Central West area accounted for the remaining 11.3 million pounds of fishery products.

Data on the freezings and holdings of fishery products for 1960 were published previously in Current Fishery Statistics No. 2495. The data were also published monthly in the Frozen Fish bulletin of the Current Fishery Statistics series.

COLD STORAGE HOLDINGS OF FROZEN FISHERY PRODUCTS

The average monthly holdings of frozen fishery products during 1960 amounted to 194.5 million pounds. Holdings were the highest on November 30, 1960 when 237.2 million pounds of fish and shellfish were in storage. December 31, 1960 was the second highest during 1960 with 230.5 million pounds, and October 31 was third with 223.2 million pounds. Holdings were at the lowest level on April 30, when stocks declined to 133.8 million pounds. The average monthly holdings were the greatest in the New England States. The Middle Atlantic States were next, followed by the Pacific Coast States.

COLD STORAGE HOLDINGS OF CURED FISH

Average monthly holdings of salted and smoked cured fish in 1960 totaled 14.7 million pounds. Cold storage stocks averaged 7.8 million pounds for cured herring and 3 million pounds for mild-cured salmon. These two species accounted for 74 per cent of the average cold storage inventories of cured fish.

GENERAL REVIEW

FOREIGN FISHERY TRADE

United States foreign trade in fishery products was valued at \$404 million during 1960. Imports for consumption accounted for \$360 million and exports \$44 million. The value of fishery imports was \$6.4 million less than in 1959 while exports were down \$77,000.

Imports of edible fishery products in 1960 amounted to 1.1 billion pounds valued at \$307 million. The volume of the imports was 4 percent less than in the previous year; however, they exceeded those for any year prior to 1959. The principal items imported were fresh and frozen tuna, whole and other, 241 million pounds; frozen groundfish fillets and blocks, 156 million pounds; and shrimp, principally frozen, 113 million pounds. Items received in considerably greater volume than in 1959 were fresh and frozen sea herring, albacore tuna, and shrimp. Sharp declines occurred in imports of fresh and frozen salmon, light meat tuna, and groundfish fillets; and canned salmon and tuna.

Imports of four important edible items were at record levels in 1960. These were fresh and frozen albacore tuna; spiny lobsters, principally frozen tails; shrimp, mainly headless and peeled; and canned oysters.

Shrimp was the major item imported with respect to value. The 113.4 million pounds received, valued at over \$56 million, came from over 40 countries. Mexico, Panama, El Salvador, and Ecuador were the principal sources. Nearly two-thirds of the total imports of shrimp were received from Mexico.

During 1960, the United States Tariff Commission assembled approximate data on the condition of imported shrimp. It was found that imports in that year consisted of the following categories: Headless, 93 million pounds; peeled (including deveined) raw, and cooked, 18.1 million pounds; breaded, 1.7 million pounds; canned, 0.5 million pounds; and dried, 0.1 million pounds.

Imports of nonedible fishery products in 1960 were valued at \$52.7 million--5 percent less than in the previous year. A sharp decline in the value of imported fish meal was responsible for the decrease. The declared value of fish meal and scrap imported in 1960 averaged less than \$84 per ton compared with nearly \$120 the previous year. Pearls worth \$14.6 million were the most valuable nonedible item imported during the year, followed by fish scrap and meal, \$11.1 million; various aquatic leathers and leather products, \$10.1 million; and fish and marine animal oils, \$6.7 million.

Exports of edible fishery products in 1960 totaled only 61 million pounds, probably the smallest volume for any year in the 20th century. Sharply reduced exports of canned salmon, sardines, and salted fish were largely responsible for the decline. In contrast to the low level of United States export trade in edible fishery products, nonedible exports were valued at a record \$18.5 million. This resulted from near record exports of fish oils, and record shipments of seal furs and unmanufactured shells.

Customs receipts from imports of aquatic products in 1960 amounted to \$15.9 million--11 percent less than in the previous year. The decrease resulted largely from sharply reduced imports of frozen groundfish fillets, canned salmon, tuna in brine, and crab meat; less duty collected on blocks of groundfish fillets due to a change in the Customs classification of this item; and because all imports of canned tuna in brine in 1960 were dutiable at 12 1/2 percent ad valorem. In the previous year, the quota on imports of tuna in brine was exceeded and nearly 3 million pounds entered at the 25 percent rate.

SECTION 2 - NEW ENGLAND FISHERIES

The commercial fisheries of Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut in 1960 yielded a catch of only 852 million pounds valued at about \$61 million to the fishermen. This was 81 million pounds less than in 1959 and the lowest since 1947. The value was the smallest since 1957, but the highest average per pound price received by fishermen since 1951. Although Maine landings were heavier than in 1959, and New Hampshire showed a slight gain, other States registered decreases.

The major factor contributing to the low 1960 catch was poor demand for otter trawl caught industrial fish. Landings plunged from 153 million pounds in 1959 to only 34 million pounds in 1960. The value was down over \$1 million. There were moderate decreases in the catches of menhaden, whiting, cod, pollock, bluefin tuna, and shad. The total catch would have been lower had there not been a gain in landings of sea herring which increased from 121 million pounds in 1959 to 155 million pounds in 1960. Receipts of sea scallops established a new record, and the catch of Maine lobsters (24 million pounds) approached the 1889 record catch of 25 million pounds. Haddock, alewives, flounders, ocean perch, and red hake landings were larger in 1960 than in 1959.

Weather was a factor in the New England fishery production. In the first week of March, the worst blizzard in New England's recent history brought the fishing industry to a standstill. In September, a hurricane prevented fishing for a period. The storm wreaked havoc on the pound net fishery of Cape Cod where 15 out of the 24 traps were rendered inoperative. Another blizzard in mid-December again suspended fishing activities.

New England lost 15 vessels at sea in 1960--one went down with a crew of three men. There was a sizeable increase in the number of vessels issued first documents as fishing craft. However, most were small older vessels entering miscellaneous minor fisheries. While there was some new vessel construction for the area's flounder and scallop fisheries, no new fishing vessels were built.

There were 22,000 fishermen engaged in New England fisheries in 1960--about 1,000 more than in 1959. This increase took place in the shore and boat fishery. Fewer men fished aboard vessels. Fishing craft operated during the year consisted of 742 vessels with a total gross weight of 44,514 tons, 11,356 motor boats, and 705 other boats.

Wholesale and manufacturing fishery firms operated in New England States in 1960 numbered 568--a few more than in 1959. The plants employed over 14,000 persons. Short term labor-management disputes at Boston and Gloucester in the spring idled some plants and curtailed production. Plant replacements were few, and existing facilities were taxed heavily to maintain production. Manufactured fishery products were valued at almost \$117 million--nearly \$4 million more than in 1959. Increases in the value of manufactured packaged raw fillets and steaks, breaded fish and shellfish, and fish and shellfish speciality items offset the sharp decrease in the value of by-products. Principal manufactured products produced were canned sardines (sea herring), clam products, and animal food; packaged fresh and frozen fillets, sticks and portions, sea scallops, and speciality items; and byproducts (meal, oil, solubles, Irish moss extract, kelp extract, pearl essence, and marine pearl shell buttons).

The domestic production of groundfish fillets amounted to 93.8 million pounds. This was slightly above the 91.1 million pounds produced in 1959 but nearly 55 million pounds less than the 148.8 million pound peak domestic production of 1951. In 1960, the total supply of groundfish fillets (domestic production plus imports) amounted to 249 million pounds. Only 38 percent of the supply came from domestically caught fish. The remainder (62 percent) was imported.

New England continued as the leading producing area for frozen fish sticks and portions. Cooked fish dinners became an important item in the speciality field. The main course of these dinners was mostly haddock and cod prepared from frozen fish blocks.

NEW ENGLAND FISHERIES

Processors had a fairly successful year and kept many shore workers employed. Increased activity in shore plants did not, however, greatly affect the domestic catch of groundfish, since requirements for these fish were met chiefly from imports of frozen blocks of groundfish fillets.

Almost all New England groundfish processors found it necessary to supplement domestic production with foreign products. In 1960, frozen blocks of groundfish fillets entered this country at a lower tariff rate than heretofore. The U. S. Bureau of Customs clarified its July 1959 ruling that allowed foreign frozen blocks of fish fillets (if block and container weigh 15 pounds or more) to enter the United States under Tariff paragraph 720 at 1 cent a pound. To qualify, shipments must contain a reasonable amount (at least 2 percent) of bits, pieces, and trimmings. Prior to the July 1959 ruling by the U.S. Customs Court in New York, all blocks of fish fillets entered under Tariff paragraph 717 as fillets at the rate of 1-7/8 cents and 2-1/2 cents a pound.

After many years of constantly increasing imports of groundfish fillets, the trend establishing a new record each year was broken in 1960 when imports amounted to 155.6 million pounds--29 million pounds less than in 1959. Despite the decline, imports were larger than for any year prior to 1959.

The 1960 Maine pack of sardines (sea herring) was a few thousand cases short of industry's pre-season goal of 2 million cases. The pack was valued at \$16.7 million--the highest since 1954. Fishing was poor early in the season indicating that the pack might be smaller than in 1959. However, fishing improved and the bulk of the catch was of good canning size. By mid-October the pack had exceeded that of 1959. About 85 percent of the production was processed in soybean oil. Sardines in mustard and tomato sauce comprised most of the remainder. The most popular size case was the 3-3/4 ounce net can packed 100 to a case. Good demand for the moderate supply of canned sardines kept wholesale prices at a high level. The pack was reported of excellent quality due to the industry's quality control and mandatory grading program.

In the years since World War II, landings of otter trawl caught industrial fish for producers of fish meal, oil, and animal foods had become an important part of the New England fishery economy. However, this industry was adversely affected by a combination of factors which began in 1959. In that year, production of fish meal and solubles was heavy and imports of these products reached the highest level since 1954. Hog and poultry farmers experienced depressed conditions owing to falling prices for their products. Since the farmers were the principal users of fish meal and solubles, high supply was coupled with sluggish demand. Inventories rose and prices fell for both domestic and imported products.

The problems of marketing fish meal and oil continued into 1960, and operations by the industrial fishing fleets and byproducts plants were curtailed. Several plants were closed for periods, and one was dismantled. Firms that did operate paid fishermen lower prices for raw material. The lighter landings and lower ex-vessel prices caused a \$1 million drop in payments for industrial fish. The decline in these landings was the principal reason for the New England catch falling to the lowest level since 1947.

Because of the limited activity in the industrial fish industry, many vessels shifted to other fisheries, particularly in the summer. This resulted in an increase in otter trawl caught haddock, ocean perch, and flounders. However, lower ex-vessel prices prevailed at all ports in 1960 for most items.

Species that support the hard-pressed New England fillet industry--groundfish and ocean perch--were landed in about the same volume as in 1959. Cod and pollock catches were less while landings of haddock and ocean perch showed good increases. Average prices paid to fishermen were 15 percent below the previous year's level.

The heavier haddock landings in 1960 were due to a good scrod catch. Scrod haddock landings were up while large haddock landings were down. With little interruption, there has been a steady downward trend in the catch of large haddock from 1938 through 1960. This indicates there are fewer larger fish available on the grounds. Scientists attributed the heavy landings in 1960 to good spawning and survival of the 1958 year class.

The area's ocean perch fishery recovered slightly in 1960 from the 1959 low. The fleet operated at capacity. More trips were completed by fewer vessels. Gloucester trawlers turned more to the Nova Scotia banks in 1960 and away from the distant Gulf of St. Lawrence and Grand Banks which had supplied a large part of the catch through most of the 1950's.

Sea scallops were landed in record volume in 1960, mostly at New Bedford, Massachusetts. The predominance of high-priced sea scallops allowed New Bedford to lead New England ports in ex-vessel value of fishery landings and to be the second ranking port in the nation on the basis of value. Georges Bank, off the Massachusetts Coast, produced scallops at a rate unparalleled since the Bureau began studies on the fishery nearly 20 years ago. The usual 10-day scalloping trips of past years were cut in half because of the excellent catches. Bureau scientists reported that the abundance of sea scallops on Georges Bank was the result of an unusually heavy set in 1955. The quick catches meant more trips and more scallops. However, dockside prices declined and reached the lowest level since World War II.

The scallop industry found itself with supplies that greatly exceeded demand. At the request of industry, the Bureau of Commercial Fisheries conducted a national campaign to promote greater consumption of scallops. A large volume was moved, and the market strengthened toward the end of the year.

Flounder landings were exceptionally good in 1960. Ex-vessel prices were generally lower, but the increased volume brought fishermen an added \$210,000. Landings of yellowtail, the leading flounder, totaled 30 million pounds. This species was abundant on Georges Bank, Nantucket Shoals, off No Man's Land, and East of the Channel. The latter area was unusually productive in October. However, heavy landings forced prices to a low level. Some fishermen dumped their catches rather than sell at the reduced prices. Other vessels remained in port for more than a week after the price drop. Fortunately, conditions improved within a short period and vessels resumed fishing. Lemon sole and blackback flounder landings were excellent. Heaviest landings occurred in May when these species moved into shallow waters and were fished by small and medium trawlers. Landings of the higher priced fluke were the heaviest since 1957.

Landings of whiting in 1960 amounted to 104 million pounds--nearly 7 million pounds less than in 1959. Maine experienced its poorest season in several years, and the catch was down 12 million pounds. The usual heavy run of whiting in Maine waters failed to materialize in June, and many whiting vessels were forced into other fisheries. Portland trawlers were at odds with the Massachusetts whiting fleet because of the latter's activity on the whiting fishing grounds in Casco Bay off the Maine Coast. Landings at Massachusetts ports were 4 million pounds larger than in 1959. They would have been greater had not processors curtailed production when the market appeared on the decline in midsummer.

NEW ENGLAND FISHERIES

Landings of sea herring at New England ports totaled 155 million pounds--28 percent greater than in 1959. Over 98 percent (152 million pounds) of the catch was landed in Maine--about 35 million pounds more than was landed there in 1959. Imports into Maine from Canada totaled 74 million pounds--10 million pounds more than in the previous year. Fishing was poor in June and July but improved late in summer. Marketable size fish comprised the bulk of the catch. In the previous year, there had been an unusually high percentage of undesirable large fish. The 1960 catch was comprised of many fish taken in the Eastern area (Washington County) where fishermen reported the best catches in years. The Central area rebounded from a particularly poor year in 1959 to nearly normal production in 1960. Fishing was spotty and productivity was limited in the Western area (Portland). Most of the domestically caught and imported sea herring were used to pack sardines.

Russian trawlers, which had previously been observed fishing off Newfoundland, made an appearance on Georges Bank in August 1960. The vessels were sighted about 160 miles off Boston Lightship. More than 160 Russian mother and catcher vessels (some of them up to 14,000 tons) were reported off Newfoundland.

There was little progress made in establishing a New England tuna fishery in 1960 (see Fish and Wildlife Service Statistical Digest No. 51, page 78). Although interest continued, establishment of a large-scale tuna fishery in the area did not occur. One plant received approval from the Gloucester Community Pier Association to construct a tuna cannery on the Gloucester Fish Pier. Attempts to interest vessels to convert to tuna longlining were unsuccessful, and the cannery was not constructed.

The Provincetown tuna purse seiner, Silver Mink, completed its shortest of three seasons. The vessel landed only 611,000 pounds of bluefin tuna compared with 1.7 million pounds in 1959. Scarcity of fish and a short season greatly reduced landings. Start of the season was delayed while arrangements were made with a cannery to handle the catch, and considerable time was lost due to adverse weather. In 1960, for the first time, aerial scouting for tuna was used by the vessel.

New England's fishing vessels continued to pay high insurance premiums, particularly for hull and protection, and indemnity insurance. It was hoped that continuation of the Bureau's safety program for New England fishing vessels would eventually result in lowering the rates. Progress was made in improving safety conditions with 109 safety items such as skid-resistant decking, inflatable life rafts, safety fish hoists, and emergency water pumps. Many of these have been adopted by the New England fleet during the past 3 years.

On June 12, 1960, the President signed P.L. 86-516 authorizing the Secretary of the Interior to pay a subsidy for the construction of fishing vessels in shipyards of the United States. The Fishing Vessel Construction Subsidy program became effective in September 1960. In the closing days of Congress, \$750,000 was appropriated for immediate use in construction differential payments. The Act authorized \$2.5 million annually for 3 years. It was believed that the Act would benefit New England fishing interests.

The President, in July, signed S. 2481 which authorizes the Secretary of the Interior to initiate a Fishing Vessel Mortgage Insurance Program. This program aroused interest among fishermen and private financial institutions in New England. The program provided for the insurance of mortgages given in connection with the construction, reconstruction, and reconditioning of a fishing vessel, up to 75 percent of the "actual cost" of the vessel. The Mortgage Insurance Program was designed to supplement the Fisheries Loan Fund Program, with funds provided by banks and private lenders. The program is for use in conjunction with the Vessel Construction Subsidy Program.

A study of costs of fishing in New England and Canadian groundfish industries, conducted by the Bureau of Business Research, Boston College, under a contract awarded by the U.S. Bureau of Commercial Fisheries, was completed in 1960. The study was designed to further analyze causes for the decline of the New England groundfish industry, and to compare its performance with the Canadian groundfish industry. In addition to the cost analysis, the study covered basic principles and theoretical economic aspects of operations of the domestic industry. Suggestions were given concerning a more rational economic approach to operations of the domestic industry.

The report pointed out that the New England groundfish fleet is comprised of a dissimilar group of vessels engaged in separate and distinct fisheries. Vessels are generally becoming old and are not being replaced. This is paralleled with an aging population of fishermen--few young men are entering the fishery. The older vessels are more costly to operate. Trip expenses have increased substantially and are difficult to adjust because of rigid, inflexible items of cost. Revenues, on the other hand, have been on a general downward trend.

Early in 1960, voluntary grade standards became effective for frozen raw breaded fish portions, an important item to New England fisheries. Standards for ocean perch fillets were completed in 1960, but did not become effective until January 22, 1961. Other products produced in New England for which standards had been established were frozen fish sticks, fish blocks, haddock fillets, and cod fillets. Considered for standards were flounder fillets, pollock fillets, frozen fried breaded scallops, and frozen fried breaded portions. Standards were developed by the U.S. Bureau of Commercial Fisheries Technological Laboratory at Gloucester, Massachusetts.

In 1960, the Bureau of Commercial Fisheries dedicated one of the world's finest technological laboratories located at Gloucester, Massachusetts. The new laboratory conducted operations in three major work areas: (1) The development of standards and specifications for fishery products; (2) preservation and engineering studies on vessels and shore; (3) chemical studies on the composition of fish and fishery byproducts.

A 10-member Marine Fisheries Advisory Commission was appointed by the Governor of Massachusetts to attempt to resolve some of the differences and problems of the various segments of marine activities in the State. Representatives from both commercial and sport fisheries were on the Commission and served until December 1. A series of 10 meetings was held throughout the year at important marine centers in the State. The Commission listened to the problems of all phases of marine activities. In a report submitted to the Governor late in the year, the Commission recommended that a permanent 10-man Advisory Commission be established to aid in solving marine problems and conflicts of interest.

The new Bureau of Commercial Fisheries Biological Laboratory at Woods Hole, Massachusetts, was completed early in the year. In March the scientific staff moved into the new quarters, which provide improved facilities for the fishery research biologists in their studies of the North Atlantic fisheries.

The laboratory in 1960 continued its extensive research to aid New England fisheries. The research program in 1960 was directed at problems associated with groundfish and sea scallops upon which much of the New England fishing industry depends. Major investigations centered around cod, haddock, ocean perch, whiting, flounders, and species taken in the industrial trawl fishery. Other shellfish research was devoted to attacking the problem of injurious predators, location of new sources and methods of collecting clam and oyster seed, and development of artificial propagation methods.

NEW ENGLAND FISHERIES

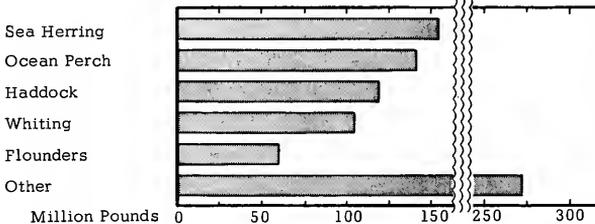

Plans were well under way for replacement of the research vessel Albatross III which was deactivated in March 1959. A vessel design was completed in late 1960, and construction was scheduled to begin in the first half of 1961. The new research vessel will contain the latest scientific equipment, and will be equipped to fish with a stern trawl. In 1960, the Bureau's exploratory fishing vessel Delaware and a chartered vessel were used to collect biological data at sea.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The Maine Department of Sea and Shore Fisheries; the New Hampshire Fish and Game Department; the Massachusetts Department of Natural Resources, Division of Marine Fisheries; the Rhode Island Department of Agriculture and Conservation, Division of Fish and Game; the Connecticut State Board of Fisheries and Game; and the Connecticut State Shell Fish Commission.

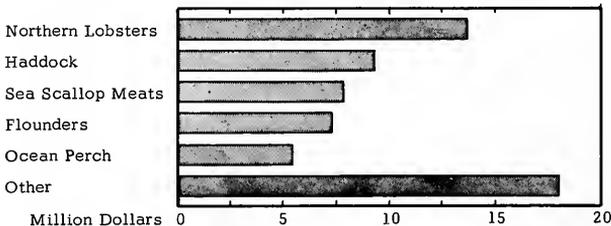

The following tables contain summarized and detailed information on the 1960 operating units and catch of fisheries in the New England States. Condensed summary data on the operating units and catch by States of the New England area, appearing on the following pages, have been previously published in Current Fishery Statistics No. 2763. Additional data on many aspects of the New England fisheries may be found in the Maine, Massachusetts, and Rhode Island monthly and annual landings bulletins released by the Branch of Statistics and in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, Commonwealth Pier, Boston, Massachusetts.

LANDINGS AT MAINE PORTS

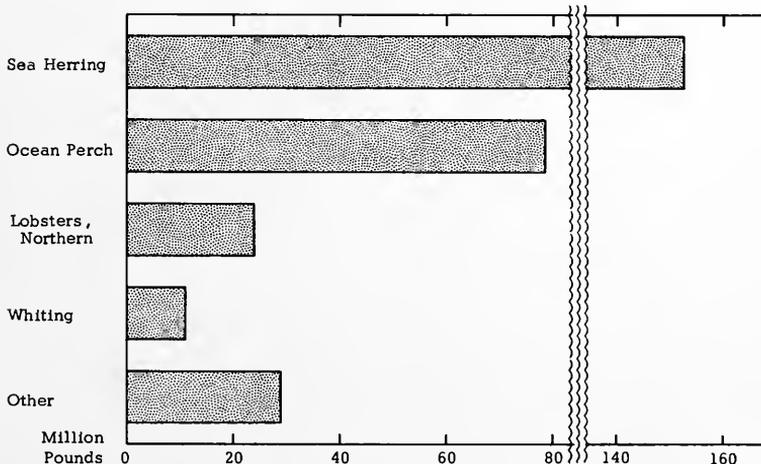

The Bureau of Commercial Fisheries, in cooperation with the Maine Department of Sea and Shore Fisheries, collects and compiles monthly and annual data on the landings of fish, shellfish, and other aquatic resources in the State of Maine. This information is published in the monthly bulletin, Maine Landings, which is in the Current Fishery Statistics series of reports. Additional detailed tabulations are prepared for the use of Bureau and State scientists and the International Commission for the Northwest Atlantic Fisheries.

A summary of data on Maine landings by species and months was included in Digests prior to 1959. This information has been omitted since that year. Instead, data on the Maine catch by gear and subarea have been included. The quantities shown represent the round weight of all species except univalve and bivalve mollusks. These shellfish are reported in pounds of meats. The statistics are comparable with catch figures shown in other tables in this report.

Landings by fishing craft of all sizes at Maine ports in 1960 amounted to 295 million pounds--nearly 29 million pounds above the amount landed in 1959. The major factor contributing to the increase was larger landings of sea herring. The catch increased from 117 million pounds in 1959 to 152 million pounds in 1960. Gains were also made in the lobster fishery. Receipts (24 million pounds) were nearly 2 million pounds larger than in 1959 and approached the 1889 record catch of 25 million pounds. The whiting fishery in Maine experienced its poorest season in several years. Compared with 1959, the catch was down 52 percent or 12 million pounds. The usual heavy run of whiting in Maine waters failed to materialize, and many fishing craft were forced into other fisheries.

LANDINGS OF CERTAIN SPECIES AT MAINE PORTS, 1960

1/ EXCLUSIVE OF DUPLICATION.

2/ ALL SPECIES ARE LISTED AS ROUND WEIGHT EXCEPT UNIVALVE AND BIVALVE MOLLUSKS WHICH ARE REPORTED AS POUNDS OF MEATS. SEA SCALLOPS ARE LISTED AS WEIGHT OF 20 LBS. HEAVY AND LIGHT CRABS WAS CONVERTED TO ROUND WEIGHT BY MULTIPLYING BY THE FOLLOWING FACTORS: COOK, DRAWN 1.17; CLUSK, DRAWN 1.13; HADDOCK, DRAWN 1.14; WHITE HAKE, DRESSED 1.34; HALIBUT, DRAWN 1.15; POLLOCK, DRAWN 1.13; TUNA, DRESSED 1.25; WHITING, DRESSED 1.66; AND WOLFFISH, DRAWN 1.20.

NOTE: OTHER TERMS ARE CLASSIFIED ACCORDING TO SIZE OF THE CRAFT. "SMALL" OTHER TRAWL CRAFT ARE THOSE 50 GROSS TONS CAPACITY AND UNDER. "MEDIUM", 51 GROSS TONS TO 15 GROSS TONS. "LARGE" ARE OVER 15 GROSS TONS OR GREATER. "DAYS ASSENT" IS THE MEASURE OF TIME TO THE NEAREST COMPLETE DAY THAT A VESSEL IS AWAY FROM PORT DURING A FISHING TRIP. WHEN A CRAFT OPERATES IN TWO OR MORE SUBAREAS DURING A VOYAGE, A FRACTIONAL PART (IN TENTHS) OF THE TRIP IS ALLOTTED TO THE SUBAREA ON THE BASIS OF THE CATCH IN EACH SUBAREA. DAYS FISHED IS THE TIME ACTUAL FISHING OPERATIONS WERE CARRIED ON, EXPRESSED TO THE NEAREST TENTH OF A DAY. TO OBTAIN FISHING TIME IN HOURS, MULTIPLY THE NUMBER OF DAYS FISHED BY 24.

NEW ENGLAND FISHERIES

LANDINGS AT MASSACHUSETTS PORTS

Detailed statistics are collected and published monthly and annually on landings at Boston, Gloucester, New Bedford, and other Massachusetts ports. Additional detailed tabulations are prepared for the use of Bureau and State scientists and the International Commission for the North-west Atlantic Fisheries. The data represent 97 percent of the total Massachusetts catch.

A summary of 1960 data on Massachusetts landings by ports and by gear and area of capture is contained in the following tables. The quantities shown represent the actual weights of the landings, therefore, they are not directly comparable with the catch figures shown in other tables in this Digest. Prior to 1959, information covering landings at individual ports by months was published in Statistical Digests. Since 1959, these data have been omitted from the reports.

Landings by fishing craft of all sizes at Boston, Gloucester, New Bedford, and certain other Massachusetts ports in 1960 amounted to 444 million pounds valued at nearly \$32 million. Compared with 1959 (501 million pounds valued at \$37 million) landings declined 11 percent in volume and 14 percent in value. During 1960, receipts at Gloucester accounted for 43 percent of the total poundage and 20 percent of the total value. Boston was second both in poundage (25 percent) and value (30 percent). New Bedford ranked third in volume with 19 percent but first in value (41 percent). Landings at other Massachusetts ports made up the remaining 13 percent in quantity and 9 percent in value.

At Boston, landings amounted to 110 million pounds--the smallest since 1922. Average ex-vessel prices paid for major species were generally lower than in the previous year. Fewer trips were landed at Boston than in 1959; but the average catch per trip was larger. Haddock was the principal species taken by the Boston fleet, and the amount landed was 4 million pounds above that of 1959. The catch of large haddock, with only few interruptions, has been decreasing steadily since 1938. However, scrod haddock fishing was very good in 1960 and accounted for the increased haddock landings. Bureau biologists attributed the heavy landings of scrod haddock in 1960 to good spawning and survival of the 1958 year class.

Gloucester landings were greater than at any other Massachusetts port but below those of 1959 and the lowest since 1953. The otter trawl industrial fishery had been important to Gloucester during the past several years. However, landings were curtailed by economic factors in 1960. Catches were down 25 million pounds. Because of the limited activity in the industrial fish industry, many vessels shifted to other fisheries. This resulted in an increase in landings of ocean perch, whiting, and other food fish.

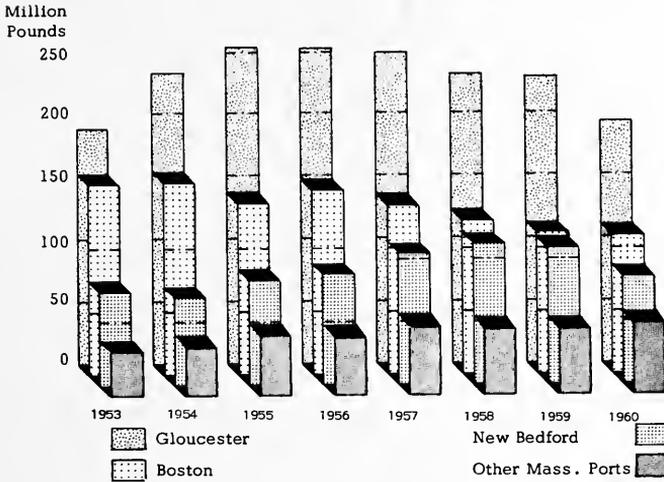

Landings at New Bedford, following the trend set at Boston and Gloucester, were less than in 1959. As in Gloucester, the otter trawl fishery for industrial species was at the point of collapse. Landings were down 67 percent. However, sea scallops were landed in record volume and catches of flounders were exceptionally good. The predominance of these high-priced items at New Bedford, allowed the city to lead all New England ports in ex-vessel value of fishery products and to become the second ranking port in the nation on the basis of value.

During 1960, fishing craft operating otter trawls captured 84 percent of the 444 million pounds of fish and shellfish landed at Boston, Gloucester, New Bedford, and other Massachusetts ports. Purse seines accounted for 8 percent of the total while scallop dredges took 5 percent. The remaining poundage was taken on lines, in pound and trap nets, by harpoons, or with gill nets. Fishing grounds off New England yielded 365 million pounds or 82 percent of the entire landings. About 17 percent was taken on grounds off Nova Scotia, while the remaining 1 percent came from the Gulf of St. Lawrence, the Grand Banks, and from areas off the Middle Atlantic States.

NOTE:—THE LANDINGS SHOWN ABOVE ACCOUNTED FOR 97 PERCENT OF THE 1960 MASSACHUSETTS CATCH. DATA ON THE LANDINGS BY MONTHS WERE RELEASED CURRENTLY IN THE BUREAU'S CURRENT FISHERY STATISTICS SERIES OF BULLETINS IN MASSACHUSETTS IN 1960, BASED ON WEIGHT OF MEATS FOR UNLIVE AND BIVALVE MOLLUSKS; AND ROUND WEIGHT FOR ALL OTHER SPECIES, TOTALLED 480,421,500 POUNDS WITH A VALUE OF \$35,947,416 TO THE FISHERMEN. THE GRADES AND SIZES GIVEN FOR CERTAIN SPECIES IN THIS REPORT WERE THOSE RECOGNIZED IN THE TRADE. "LARGE" COD ARE CLASSIFIED AS THOSE WEIGHING OVER 10 POUNDS; "MARKET" COD, 2-1/2 TO 10 POUNDS; AND "SCROD" COD, 1-1/2 TO 2-1/2 POUNDS. "LARGE" HADDOCK ARE THOSE WEIGHING OVER 2-1/2 POUNDS, AND "SCROD" HADDOCK, 1-1/2 TO 2-1/2 POUNDS. "LARGE" HAKE ARE THOSE WEIGHING OVER 6 POUNDS, AND "SMALL" HAKE, UNDER 6 POUNDS. THE FOLLOWING TERMS INDICATE THE CONDITION IN WHICH LANDED: "ROUND", AS CAUGHT; "DRAWN", Eviscerated; AND "DRESSED", Eviscerated AND HEADED. THE CATEGORY "OTHER MASSACHUSETTS PORTS" INCLUDES PELHOUNT, PROVINCETOWN, AND OTHER CAPE COD PORTS.

INCIDENTAL CATCH:																				
EXCLUSIVE OF DUPLICATION, 2/																				

NOTE:--THE LANDINGS SHOWN ABOVE ACCOUNTED FOR 98 PERCENT OF THE 1960 MASSACHUSETTS CATCH. DATA ON THE MONTHLY CATCH BY GEAR AND SUBAREA WERE RELEASED CURRENTLY IN THE BUREAU'S CURRENT FISHERY STATISTICS. THE REMAINING 2 PERCENT CONSISTED OF 96 TONS OF CRABS, 12 MILLION POUNDS AND CONSISTED LARGELY OF FINFISH, CRABS, NORTHERN LOBSTERS, CLAMS, SEA MUSSELS, OYSTERS, BAY SCALLOPS, AND BIVALVE MOLLUSKS, AND ROUND WEIGHT FOR ALL OTHER SPECIES. THE CATCHES FOR UNIVALENT TRAWL CRAFT ARE THOSE 50 GROSS TONS CAPACITY OR UNDER; "MEDIUM", 51 GROSS TONS TO 150 GROSS TONS; AND "LARGE", 151 GROSS TONS OR GREATER. A SINGLE TRIP IS REPORTED FOR EACH VESSEL. DATES ABSENT IS THE MEASURE OF TIME TO THE NEAREST COMPLETE DAY THAT A VESSEL IS AWAY FROM PORT DURING A FISHING TRIP. WHEN A CRAFT OPERATES IN THE NANTUCKET SHOALS AND LIGHTSHIP AREA, THE PART IN TENS (S) OF THE TRIP IS ALLOTTED TO THE SUBAREA ON THE BASIS OF THE CATCH TAKEN IN EACH SUBAREA. "OCCASIONAL" AFTER THE NAME OF SUBAREA AND THE PART IN TENS (S) OF THE TRIP IS ALLOTTED TO THE SUBAREA WITH ANOTHER TYPE OF GEAR. DAYS FISHED IS THE TIME ACTUAL FISHING OPERATIONS WERE CARRIED ON, EXPRESSED TO THE NEAREST TENTH OF A DAY. TO OBTAIN FISHING TIME IN HOURS, MULTIPLY THE NUMBER OF DAYS FISHED BY 24.

SECTION 3 - MIDDLE ATLANTIC FISHERIES

The 1960 commercial catch of fish and shellfish in the coastal areas of the Middle Atlantic States (New York, New Jersey, and Delaware) amounted to 784 million pounds valued at \$22 million to the fishermen. Compared with the previous year, the 1960 catch represented an increase of 23 million pounds or 3 percent in volume, but a decrease of \$1 million or 4 percent in value. The value of the catch was the lowest since 1944. Increased catches of menhaden were responsible for most of the gain in volume. The lower value of the catch was mainly due to a decline in the value of menhaden resulting from sharply reduced prices for menhaden meal and solubles.

Menhaden was in first place in the volume of the Middle Atlantic catch with 671 million pounds--an increase of 18 million pounds compared with 1959. Clam meats were second (32 million pounds), followed by scup or porgy (27 million pounds), and flounders (12 million pounds).

New Jersey led all other States in volume accounting for 48 percent of the total landings for the Middle Atlantic States. Delaware was in second place with 36 percent and New York accounted for the remaining 16 percent. New Jersey also led in value, accounting for 44 percent of the total. New York was second with 40 percent, and Delaware accounted for the remaining 16 percent.

There were 8,332 fishermen engaged in making the catch in 1960--151 more than in the previous year. The increase occurred in New York, as both New Jersey and Delaware had less fishermen than in 1959. Commercial fishing craft operated in these States during the year consisted of 621 vessels of 5 net tons or greater (39 more than in the previous year) and 3,391 motor boats, and 627 other boats.

There were 502 wholesale and manufacturing establishments operating in the area during 1960. These firms gave employment to over 8,000 persons. Fishery products manufactured by these firms were valued at over \$80 million--\$5 million more than in 1959.

The oyster fishery of the Middle Atlantic States continued its downward trend. The volume decreased 17 percent and the value, 6 percent. A record low was reached when only 1.2 million pounds of meats were harvested. Higher prices for the shucked product created some consumer resistance, but the popularity of the mollusks caused prices to increase. Fishermen averaged over \$1 per pound for oyster meats in 1960.

The otter trawl fleet continued to drag for lobsters along the Jersey Coast resulting in a 13-percent increase in the total volume of lobsters landed.

Landings of blue crabs in the Middle Atlantic States were larger than in 1959. Increasing popularity caused a greater demand. Prices to fishermen improved, and more fishing effort was expended for these shellfish.

Landings of several species of flounders were better in 1960 than in 1959. The catch of yellowtails almost doubled, and blackback landings were up 25 percent. Production of fluke declined, but the value improved.

A large run of small striped bass in New York resulted in a record catch for that species in 1960.

Despite a rather gloomy opening season caused by depressed meal prices, menhaden fishing continued during the year at a steady pace resulting in a 3-percent increase in the volume of fish landed. Mechanization of fishing operations permitted vessel operators to reduce the average number of crewmen to 17. In the previous year, the average crew consisted of 19 men.

MIDDLE ATLANTIC FISHERIES

Marketing of fresh fish through the two major fish marketing channels--Fulton Fish Market, New York City; and the Philadelphia market--continued to decline. Markets for fresh fish appeared to be spreading more to outlying districts where wholesalers obtained their supplies directly from production centers. In addition, the frozen fish trade, including cooked fish sticks and portions, appeared to be replacing the fresh fish market.

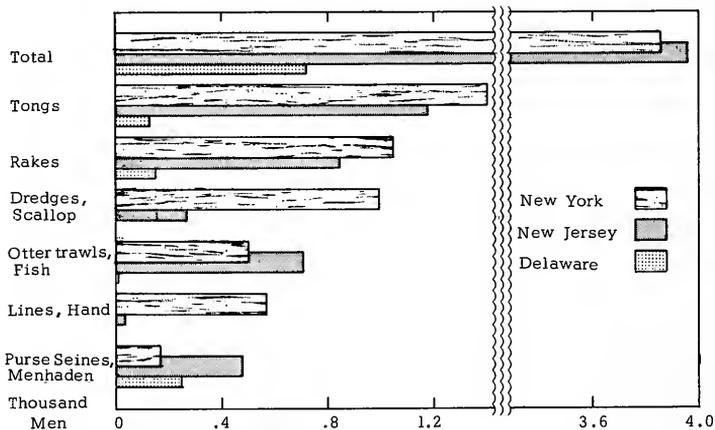

Weather affected the fisheries only slightly during 1960. One hurricane sideswiped the Coast causing some damage to pound net operations and considerable loss to many shore fishermen. The loss was reflected in a decline in the catch of sea bass.

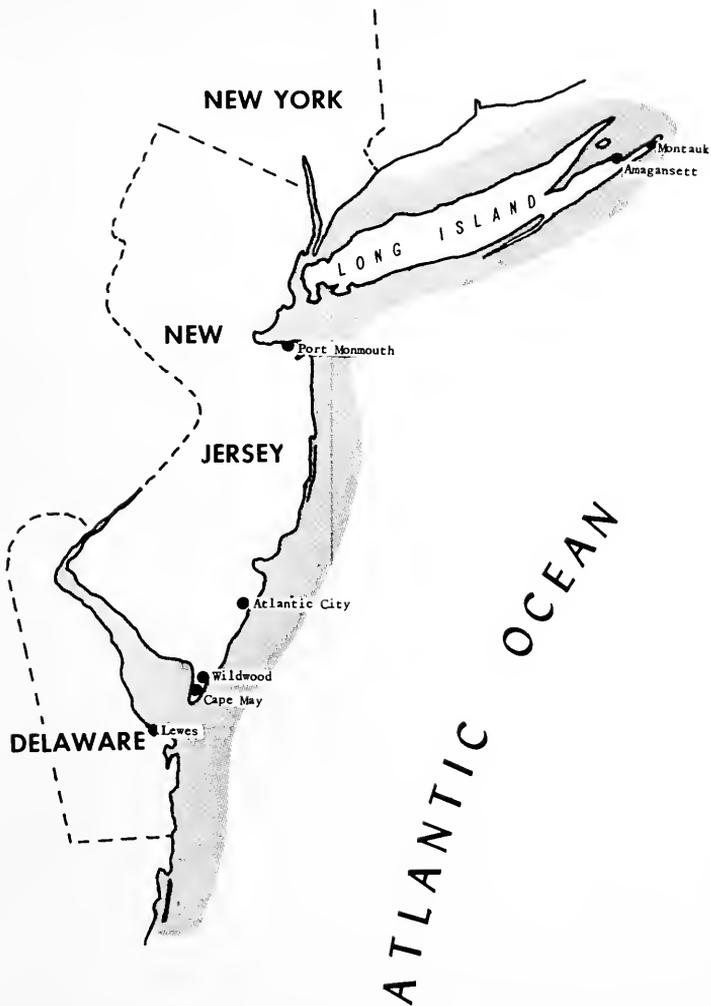

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The New York Conservation Department; the Division of Fish and Game and the Division of Shell Fisheries of the New Jersey Department of Conservation and Economic Development; and the University of Delaware Marine Research Laboratory and the Delaware Commission of Shell Fisheries.

Condensed summary data of the operating units and catch by States of the fisheries of the Middle Atlantic area appearing on the following pages have been previously published in Current Fishery Statistics No. 2566. Seasonal variation in the catch of fish and shellfish in the New York Marine District and in New Jersey can be ascertained from monthly and annual landing bulletins issued for these States in cooperation with the fishery agency of each State. Additional data on many aspects of the Middle Atlantic fisheries may be found in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, 155 John Street, New York 38, New York.

RUNAROUND GILL NET

MIDDLE ATLANTIC FISHERIES

HUDSON RIVER SHAD FISHERY

The 1960 spring run of shad in the Hudson River yielded a commercial catch of 208,855 fish weighing 723,572 pounds valued at \$108,100 to the fishermen. This was a decrease of 38 percent in volume and 14 percent in value compared with the 1959 catch. Fishermen received an average price of 15 cents per pound for shad during 1960 compared with 11 cents per pound the previous year.

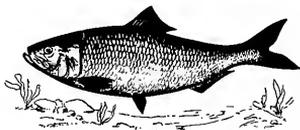

In 1960, a total of 211 fishermen were engaged in the Hudson River shad fishery--10 percent less than operated in 1959. Statistics on the 1960 catch of shad and operating units of New Jersey and New York fishermen are included in catch and operating unit data for these States.

SHAD

SECTION 4 - CHESAPEAKE FISHERIES

The 1960 commercial catch of fish and shellfish landed in Maryland and Virginia totaled 436 million pounds valued at \$35 million to the fishermen. Landings were 154 million pounds and \$4 million less than the area's record catch and value established in 1959 (over 500 million pounds valued at over \$38 million). The lower catch in 1960 was due to a drastic reduction in menhaden landings and a falling off in the take of oysters, croakers, alewives, flounders, shad, swellfish, white perch, and common eels. The only major items taken in greater volume than in the previous year were crabs, scup, clams, and spot. Virginia produced 367 million pounds (84 percent) valued at \$21 million (60 percent) of the total landings in the Chesapeake States. The Maryland and Virginia catch was taken by 19,472 fishermen operating 1,228 vessels of 5 net tons and over, 9,843 motor boats, and 1,213 other boats.

Manufactured fishery products were produced by 631 establishments in 1960--somewhat less than in the previous year. The firms employed nearly 14,000 persons. About \$55 million worth of manufactured fishery products were produced. This was nearly \$2 million less than in 1959. The decline was due to a sharp decrease in byproducts of menhaden. The value of the manufactured fishery products would have been lower had there not been an increase in breaded fish and shellfish items, specialties of these products, and canned and cured fish.

Menhaden were abundant in Chesapeake waters in 1960, however, operations were restricted because of the low price of fish meal, and the catch totaled only 249 million pounds valued at \$2 million to the fishermen. This was 40 percent less in volume and 48 percent less in value compared with the record 1959 landings. The 1960 catch was the smallest since 1956, a year when fish were not plentiful and the fishery was disturbed by adverse weather.

A drastic falling off in the price of fish meal and solubles, products of the menhaden fishery, occurred late in 1959. Early 1960 found the market in an acute stage of recession. Inventories, at a high level, were moving slowly at reduced prices. Unfavorable marketing conditions continued into the 1960 season. Manufacturers had little incentive to produce; this feeling was reflected in the operations of the fishermen. Fewer vessels fished, and limits were imposed on the volume landed. Some factories did not begin producing until late in the season and at least one plant suspended operations for a month in midseason.

The area's purse seine fleet captured 223 million pounds or 90 percent of the total Chesapeake menhaden landings. An additional 21 million pounds were taken in pound nets while the remaining 5 million pounds were caught by haul seines, hoop and fyke nets, and by gill nets. While some catches were made at sea, the greater proportion of the harvest was taken in Chesapeake Bay. All of the purse seine catch, taken by 27 vessels, was landed in Virginia.

Studies designed to develop new uses for menhaden products were continued in 1960. These, if successful, would free the industry from its dependence on the margarine and animal food markets. Except for a few million pounds used as bait for the taking of crabs by pots or trotlines, almost all of the 1960 menhaden catch was used to manufacture these products.

The Chesapeake Bay and its tributary streams form the greatest shellfish area known to the world. In 1960, it led all other areas along the Atlantic and Gulf Coasts in the yield of blue crabs, soft clams, and oysters. The Chesapeake waters gave up 55 percent of the oyster meats and 46 percent of the blue crab production taken from Atlantic and Gulf waters. The importance of shellfish to the fisheries of the Chesapeake States is shown by the fact that they accounted for 77 percent of the value of all fishery products landed in these States.

CHESAPEAKE FISHERIES

Oyster production in the Chesapeake States was the lowest since 1951. Catches were down in both States. The Maryland fishery produced 11.8 million pounds--195,000 pounds less than in 1959 and the smallest production since 1933. In Virginia, fishermen took only 15.3 million pounds--28 percent less than in 1959 and the lowest catch since 1951. With production from New England and Middle Atlantic waters at an alltime low, the demand for Chesapeake oysters outstripped the supply and prices were higher than in 1959.

The serious condition of the Chesapeake oyster fishery was of major concern to the industry. Disastrous mortalities virtually wiped out the industry in Delaware Bay and nearby waters. Serious losses also occurred during the year in the Chincoteague Bay area. There were indications that oysters were also threatened in other Chesapeake Bay areas. *Dermocystidium*, predators, oxygen deficiencies, etc., contributed to the oyster mortalities. However, a parasite known as MSX was found in many sick and dead oysters and was considered a major cause of mortality in Delaware Bay, the lower Chesapeake Bay, and Chincoteague Bay. The organism was expected to spread to other areas.

Teams of scientists at Rutgers University, the Virginia Fisheries Laboratory, the U. S. Bureau of Commercial Fisheries, and the University of Delaware have been making a vigorous attack on problems relating to oyster mortalities. The Chesapeake Biological Laboratory conducted a similar research program in cooperation with other institutions. The combined approach is the largest co-ordinated research program ever mounted against a threat to coastal shellfish. Continued research by agencies upon oyster mortalities was planned to include: (1) Accurate determination of rates of mortality by all agents under different environmental conditions; (2) complete knowledge of the life cycle of MSX organism; (3) the method of infection of oysters by MSX; (4) the role in oyster mortality played by bacteria, virus infection, and other organisms; (5) the effects of changed environmental conditions upon oyster mortality; and (6) the selection and development of resistant strains of oysters in affected areas.

Blue crabs constitute an important fishery in the Chesapeake area. The value received by fishermen for these crustaceans in 1960 amounted to \$4.6 million. Only oysters were more valuable. The 1960 crab catch (71 million pounds) was 25 million pounds larger than in 1959 and approached the 1950 record catch of 80 million pounds. The harvest was unusual in that there was an acute shortage of crabs during the first 6 months of 1960 when they are normally abundant. The light supply resulted in high prices. Processors were less affected by the snortage than fishermen since they augmented supplies by importing considerable quantities of crabs from areas as far south as Florida. As a result, crab meat production was fairly good even during the period of small catches.

Scientists at the Virginia Fisheries Laboratory predicted that the shortage of blue crabs would end by midsummer. They based this on their belief that a large supply of crabs was produced from spawning in 1959. This was determined by numerous fingernailsized crabs observed during the Laboratory's monthly surveys. It was known by scientists that all of the crabs that will be caught in Chesapeake Bay in a given summer are also present during the preceding winter. There is no significant outside source. Another indication was the increase in the number of soft and peeler crabs caught in early summer, 1960.

The prediction was correct. In late July and during the remaining months of the year, fishermen took large catches. The late season oversupplied the market, and prices fell off. However, conditions would have been worse had it not been for pasteurization. This method of preparation increases the shelf life of crab meat from a period of 10 days to as long as 6 months. Excess crab meat in 1960 was pasteurized and stored until demand improved.

CHESAPEAKE FISHERIES

The soft clam fishery increased production from 4.5 million pounds of meats in 1959 to 5.6 million pounds in 1960. The industry was confined principally to Maryland. Strangely enough, soft clams are not featured in Maryland; but are highly favored in the northeastern States. The demand from those States controls Maryland's catch. If demands from other areas developed, expansion of this fishery would be insured.

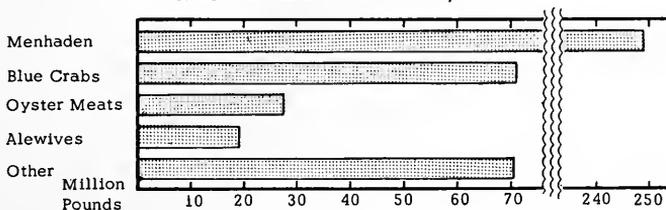

Unlike the soft clam, production of surf clams was down from 850,000 pounds of meats in 1959 to 420,000 pounds in 1960. The catch would have been larger had not increased competition from fishermen in the Middle Atlantic forced prices to a low level. Clams are scarcer in Maryland than in the Middle Atlantic, and the beds are further from home ports. Maryland fishermen could not operate on the low price paid for surf clams; the operating units turned to other fisheries for income.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this Section: Maryland Natural Resources Institute, and Maryland Department of Tidewater Fisheries; the Virginia Commission of Fisheries, and Virginia Institute of Marine Science.

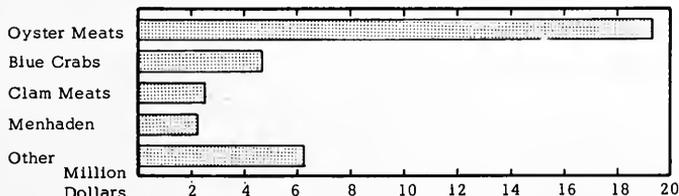

Condensed summary data of the operating units and catch by States of the fisheries of the Chesapeake area appearing on the following pages have been previously published in Current Fishery Statistics No. 2685. Data on the catch of fish and shellfish in the bay and ocean areas of Maryland and Virginia are shown at the end of this section. Additional data may be found in the Maryland and Virginia monthly and annual landing bulletins released by the Branch of Statistics. Information on the daily, monthly, and annual production of fishery products in the more important areas of these States is available in reports published by the Bureau's Fishery Market News Service office at Hampton, Virginia.

POTOMAC RIVER SHAD AND ALEWIFE FISHERY

The catch of shad in the Potomac River during 1960 amounted to 71,683 fish weighing 189,400 pounds and valued at \$28,248 to the fishermen. Although the number of fish taken was 18 percent greater than in 1959, the poundage increased only 1 percent while the value declined 10 percent.

The 1960 Potomac River alewife catch totaled 13 million fish weighing nearly 6 million pounds valued at \$87,122. Compared with 1959, this was a decline of 21 percent in the number, pounds, and also in the value of fish taken.

In 1960, there were 538 fishermen engaged in the Potomac River shad and alewife fisheries, compared with 625 during 1959. Statistics on the catch and operating units of these fisheries are included in catch and operating unit data for Virginia and Maryland.

^{1/} MARYLAND DATA INCLUDE THE OPERATING UNITS AND CATCH OF 110 UNLICENSED GILL NETS UNDER 100 YARDS IN LENGTH.

The 1960 catch of fish and shellfish landed at ports of the South Atlantic States (North Carolina, South Carolina, Georgia, and the East Coast of Florida) and the commercial catch from the inland lakes of Florida amounted to almost 379 million pounds valued at approximately \$20 million. Compared with the previous year, this represented a decrease of almost 90 million pounds or 19 percent in volume. However, the value of the catch at the fishermen's level increased \$1.4 million or 7 percent. Gains in the volume of landings of shrimp, crabs, and oysters were insufficient to overcome the large decline in menhaden landings. The greater total value of the catch resulted from increases in both the volume of the catch and prices paid fishermen for landings of shrimp and oysters. During 1960, a total of 12,928 fishermen operated in the South Atlantic area compared with 14,188 the previous year. The number of vessels of 5 net tons and over operating in this area decreased from 1,219 in 1959 to 1,174 in 1960.

There were 454 fishery wholesaling and manufacturing establishments operating in the South Atlantic States compared with 484 the previous year. These firms gave employment to over 8,000 people. Fishery products manufactured by these firms were valued at over \$41 million--an increase of more than \$1 million compared with the previous year. Chiefly responsible for the higher value of manufactured products was the tremendous increase in peeled and deveined shrimp. The production of this item more than doubled the quantity produced in 1959.

North Carolina led the South Atlantic States in volume of landings accounting for 70 percent of the total volume of fish and shellfish. The East Coast of Florida was next with 16 percent followed by Georgia and South Carolina with 7 percent each. Increases over the previous year were recorded in two of the South Atlantic States, South Carolina and Georgia.

The menhaden catch of 215 million pounds was 115 million pounds less than in 1959. The poor season was attributed to a reduction in the number of vessels due to the depressed meal and oil market and the severe weather conditions prevalent in the month of December which curtailed fishing operations along the North Carolina Coast. Large schools of fish were reported to have passed along the Coast without being fished. This was in direct contrast to the previous season when the excellent fall weather contributed substantially to that year's large production.

The 1960 catch of shellfish in the South Atlantic States, principally crabs (44.9 million pounds) and shrimp (31.2 million pounds), amounted to 81.7 million pounds valued at \$12.8 million. This represented an increase of 17 percent in volume and 27 percent in value compared with the previous year. North Carolina was the only State reporting a decline in shellfish production.

The South Atlantic shrimp industry experienced a slight recovery in 1960 from the disastrous 1959 season. Production was up 20 percent and value, 30 percent. Although shrimp landings in North Carolina showed a slight decline, those in South Carolina were the largest in 10 years. The decline in North Carolina was caused largely by a failure of the pink shrimp fishery which declined 40 percent. The catch of white shrimp, a minor item in the North Carolina shrimp fishery, was up sharply with a catch of 392,000 pounds--over three times the previous year's production.

In South Carolina the catch of shrimp (8 million pounds) was 7 percent more than in 1959. Landings of white shrimp were up 26 percent while brown shrimp declined 21 percent. An important factor in the South Carolina shrimp fishery was the management program established by the Director of the Division of Commercial Fisheries, Wildlife Resources Department. Regular trawling stations were established for the purpose of determining the abundance and size of shrimp in specified areas. When the abundance and size of shrimp justified extending the season, it was authorized, thus increasing the harvest. An important factor in the South Carolina fishery was the greater proportion of large shrimp in the 1960 catch of both the brown and white species.

Shrimp landings in Georgia were the highest in 10 years due to large supplies of both brown and white shrimp. Brown shrimp landings were up 12 percent while white shrimp landings increased by 45 percent over the previous year. The phenomenal abundance of white shrimp was the principal reason for the overall increase. During May and June, an unusual concentration of jellyfish occurred off the Georgia Coast interrupting shrimp fishing for a considerable period. Had it not been for this interference, landings would have been even greater.

The shrimp fishery in Northeast Florida evidenced somewhat the same pattern as in the other South Atlantic States with white shrimp landings 68 percent greater than in the previous year. Because of improved shrimp fishing in the Gulf, it is believed more of the South Atlantic craft moved into Gulf waters in search of better fishing, thus improving the lot of the vessel owners who remained in this section.

A new high was established in the blue crab fishery of the South Atlantic States during 1960 with record landings in North Carolina, South Carolina, and Georgia. Otter trawl caught crabs played an important part in the early spring months and provided sufficient production to stabilize prices over the entire season. Since crabs were in short supply in Chesapeake Bay early in the year, there was a tendency to ship crabs from the South Atlantic to Chesapeake Bay for processing.

Production of oyster meats in the South Atlantic States during 1960 was 17 percent greater than in the previous year, while the value of landings increased 49 percent. Shortages of oysters in the Middle Atlantic and Chesapeake States increased the demand for the South Atlantic oysters, and prices rose steadily, causing more than normal fishing effort. South Carolina oyster landings increased by 37 percent over the previous year. Better management practices by State conservation officials and improved hydrographic conditions contributed to the increase. Landings in North Carolina and Georgia were less than in 1959. In North Carolina, it was believed by those managing the industry that overfishing the reefs the previous year may have contributed to the decline. The Georgia decline was caused chiefly by failure of the canneries to operate.

The production of shucked oysters increased 8 percent during 1960, while the value of the product increased 10 percent. A steady market as a result of shorter supplies further north accounted for the increase in value.

One of the most important discoveries in recent years occurred during 1960 when the Bureau's exploratory fishing vessel, Silver Bay, discovered huge beds of calico scallops just east of Cape Canaveral, Florida. The concentrations were described as some of the greatest ever discovered. The absence of an economical shucking device and a lack of a market for the scallops prevented immediate development of the resource.

The catch of dragger caught fish, such as sea trout, in the South Atlantic States was less than in the previous year. There appears to be no logical reason advanced for the decline which has occurred in recent years.

Mullet landings in 1960 were up sharply in North Carolina, but declined in South Carolina and on the East Coast of Florida. Improved prices in 1960 were limited to North Carolina where the fish were larger, contained more roe, and consequently were in greater demand. Bluefish and Spanish mackerel were less plentiful in 1960.

Biological research emphasis in the South Atlantic States shifted somewhat during 1960. Shad research, which had held an important place for many years, was curtailed. Greater emphasis was placed on the study of the blue crab--a fishery which had come in for considerable fishing pressure during the past few years. The industry and State conservation agencies were interested in knowing whether this fishery could stand the continued pressure to which it was being subjected. Menhaden research continued at a steady pace.

SOUTH ATLANTIC FISHERIES

The Southeastern Fisheries Association meeting at St. Simons Island, Georgia, drew together members of the industry not only from the Southeastern States but as far away as Louisiana and Texas. The theme of the meeting was more unity among all members of the industry concerning the major problems confronting the industry. Among the problems discussed were pollution, conservation practices, and imports of shrimp.

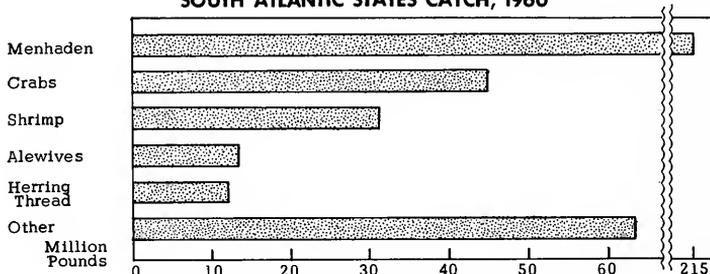

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The North Carolina Department of Conservation and Development, Division of Commercial Fisheries; South Carolina Wildlife Resources Department, Division of Commercial Fisheries; Georgia Game and Fish Commission, Coastal Fisheries Division; and Florida State Board of Conservation and Marine Laboratory, University of Miami.

Condensed summary data on the operating units and catch of the South Atlantic section appearing on the following pages have been previously published in Current Fishery Statistics No. 2478. Seasonal variation in the catch of fish and shellfish in North Carolina, South Carolina, Georgia, and Florida can be ascertained from the 1960 landing bulletins issued for these four States in cooperation with the fishery agency in each State. Additional data on many aspects of the South Atlantic fisheries may be found in the daily, monthly, and annual reports published by the Hampton, Virginia, Market News Office of the Bureau.

SHRIMP

SOUTH ATLANTIC FISHERIES

SOUTH ATLANTIC SHRIMP FISHERY

Landings of shrimp at ports in the South Atlantic States during 1960 totaled 18.6 million pounds (heads-off), for which fishermen received \$8.5 million. Compared with the previous year, this was an increase of 20 percent in volume and 30 percent in value.

Georgia led the South Atlantic States in the production of shrimp with landings of 6.2 million pounds (heads-off), followed by South Carolina, 4.8 million; East Coast of Florida, 4 million; and North Carolina, 3.6 million. White shrimp accounted for 66 percent of the catch; brown shrimp, 30 percent; and pink shrimp, 4 percent.

Shrimp with a count 31-40 per pound, heads-off, accounted for 29 percent of the catch; 26-30 count, 24 percent; and 15-25 count, 17 percent. The 41-and-over size accounted for 30 percent.

Despite an increase in catch and higher average prices, construction of shrimp trawlers was below normal. Only 45 fishing vessels of all types received first documents as fishing craft in the area during 1960, compared with 76 in 1959, and an average of 112 during the previous 10 years.

One hurricane, Donna, struck the North Carolina Coast in September causing considerable damage to the fishing fleet and shore establishments. After the hurricane passed and fishing was resumed, the fleet was unable to locate the shrimp for the remainder of the season. Georgia fishermen encountered large quantities of jellyfish during June and July, which damaged trawl nets and increased the effort required to make the catch.

The quantities shown in the following tables are based on the heads-off weight of the shrimp and are not directly comparable with the volume data published in the General Review, regional tables, or the Review of Certain Major Fisheries, which represent the round weight of the catch. The pounds of heads-off shrimp may be converted to heads-on weight by multiplying by 1.68. The common names of the species used in these tables are as follows: Brown shrimp (Penaeus aztecus), pink shrimp (Penaeus duorarum), and white shrimp (Penaeus setiferus).

Information on the landings of shrimp in the South Atlantic States contained in the following tables has previously been published in Current Fishery Statistics No. 2604. Monthly data on landings of shrimp in the Gulf States by species, size, volume, and landed value in each State; the number of fishing trips; days fished; and the catch by area, depth, and size of shrimp are included in Section 6 of this Digest.

SECTION 6 - GULF FISHERIES

The commercial catch of fish and shellfish landed at ports of the Gulf States (West Coast of Florida, Alabama, Mississippi, Louisiana, and Texas) during 1960 amounted to a record 1.3 billion pounds with an ex-vessel value of nearly \$85.5 million. Both the volume (up nearly 111 million pounds) and the value (up \$7.8 million) were 10 percent greater than in 1959. Louisiana again led in volume, while Texas maintained its lead in value. Each of the other Gulf States also showed an increase in value over 1959. The largest percentage gain in volume was in Mississippi, where landings were up 24 percent, while Alabama, down 14 percent, was the only Gulf State registering a decline. Louisiana accounted for 45 percent of the total Gulf landings. Mississippi was next with 25 percent, followed by Texas with 19 percent; the West Coast of Florida, 10 percent; and Alabama, 1 percent.

Five items accounted for nearly 90 percent of the Gulf catch in 1960. Menhaden, the principal species taken, were abundant and yielded a catch of 841 million pounds--an increase of 89 million pounds over the previous year. The catch of shrimp--206 million pounds--was up 6 percent; crabs, 36 million pounds, were up 21 percent; and oysters, 16 million pounds of meats, were up 17 percent. Among the five items, only mullet showed a decline--the catch of 32 million pounds was 1 percent less than in 1959.

The 743 fishery wholesaling and manufacturing establishments operated in the Gulf during 1960 employed about 18,000 persons, and produced fishery products valued at \$149 million--about \$26 million more than in the previous year. Principally responsible for the gain was an increase in the production of breaded shrimp and individually frozen peeled and deveined shrimp.

Weather conditions along the Gulf Coast were about normal, and there was no unusual interruption in fishing because of severe freezes or winter "northers." Early in September, hurricane Donna struck the Florida Keys, inflicting heavy damage to the spiny lobster fishery, and causing some damage to shore establishments in the lower peninsula. After passing into the Gulf, the storm took a more northerly course along the west coast of the State, passing inland south of Tampa. Damage in this area was not extensive. As is sometimes the case, good shrimp fishing followed the hurricane. A second hurricane, Ethel, struck the Mississippi Gulf Coast near Biloxi in late September, but the storm diminished greatly in intensity before striking land; and although debris hampered fishing operations for a short time, there was little damage to the fleet or to shore installations. Rainfall along the Gulf Coast was lighter than in 1959.

The shrimp fishery recovered slightly from the severe economic reversal suffered in 1959, when, although landings increased 12 percent, the value decreased 21 percent due to a sharp drop in ex-vessel prices. In contrast, in 1960, the volume was up 6 percent and the value increased 14 percent. Texas accounted for 40 percent of the total catch. Louisiana was next with 30 percent, followed by the West Coast of Florida with 22 percent; Mississippi, 5 percent; and Alabama, 3 percent. The Horn Island shrimp fishery off the Mississippi Coast was unprofitable. Shrimp were abnormally scarce, fishing effort was reduced as craft shifted to Texas grounds, and production declined 14 percent. In 1959, the harvesting of large quantities of small shrimp made this area very productive. Craft fishing in the Gulf of Mexico during 1960 made 6 percent more trips, and fished 6 percent more days than in the previous year. The Apalachicola area had a very good year--the 1960 catch increased 68 percent over 1959. However, much more fishing effort was required to take the catch, which included more small shrimp; more vessels were in the area than for several years, and the number of trips increased 24 percent.

During 1960, a record 14.7 million pounds of heads-off shrimp were landed at Florida ports from the Sanibel-Tortugas area, with only slightly greater effort than in 1959, but since small shrimp were more prevalent, they constituted a greater proportion of the catch, and resulted in a lower average price to the fishermen.

GULF FISHERIES

The area from the mouth of the Mississippi River to Texas produced 8 percent more shrimp than in the previous year, but 16 percent more trips and 21 percent more fishing days were required. Small shrimp (41-and-over count) made up a greater part of the catch than in the previous year.

Craft operating in waters off the Texas Coast caught 18 percent more shrimp in 1960, but as was true along the Louisiana Coast, approximately a 20-percent increase in trips and days fished was required to accomplish this. Compared with 1959, the 1960 catch was made up of considerably more small shrimp.

A decline in fishing activities off the Mexican Coast during 1960 resulted in a reduced catch from this area.

Industry concern over imports of shrimp continued. During 1960, these imports amounted to a record 113.4 million pounds, as received--up 6 million pounds compared with the previous year. The estimated heads-on weight of the imported shrimp (197.5 million pounds) was only 52 million pounds less than the domestic catch of these shellfish. Concerted industry efforts, primarily through the National Shrimp Congress, were made to have legislation enacted to "provide for an orderly flow of imports to prevent the flooding of the domestic market."

Production of principal processed shrimp items was larger than in the previous year. Peeled and deveined shrimp, usually individually quick frozen, increased 45 percent; frozen raw headless, 35 percent; breaded, 32 percent; and canned, 16 percent. Increases were also noted in the production of speciality items such as stuffed shrimp, shrimpburgers, shrimp creole, and shrimp in a basket. Since imported shrimp are utilized in the production of peeled and deveined, breaded, and shrimp speciality items, it was not possible to determine the percentage of domestic landings used in these products.

Shrimp canning operations were at slightly higher levels than in the previous year and the Gulf pack was 119,165 cases greater than in 1959. Plant operators, who were somewhat reluctant to go into full-scale production during the spring season because of inventories remaining from the previous year, found it difficult to obtain sufficient quantities of small shrimp to meet the market demands during the fall and winter months.

A shrimp grading machine, adaptable for both headless and heads-on shrimp, was developed to provide a fast, easy method for separating smaller size shrimp aboard vessels. A few of these graders were installed on trawlers operating out of Brownsville, Texas.

The mullet fishery did not materially improve during the year. Landings were only 1 percent less than in 1959, but more roe was salted because of a sagging market for fresh whole fish. The mullet fishery continued to be a serious problem.

Spotted sea trout landings were 4 percent less in 1960 than in 1959. All Gulf States except Texas registered declines when compared with the previous year.

The red snapper fishery remained almost static in 1960, but beneath the surface signs of trouble could be detected. The volume was unchanged from 1959, but the value declined 1 percent. Snapper fishermen have declined in numbers for several years. There was a tendency in 1960 to save the small snappers caught by the shrimp trawls rather than to go after the larger fish with lines. Despite financial difficulties, shrimp fishermen did not take advantage of the opportunity for extra income by an occasional snapper trip as readily as might be expected. This undoubtedly resulted from the failure of prices to keep pace with advancing costs over the past decade.

The year was a good one for the Spanish mackerel fishermen. Fish were plentiful along the West Coast of Florida in more than the usual numbers, and prices held up well. The purse seine and power block were introduced into the Florida mackerel fishery in 1960 on an experimental basis. Spotter planes were employed for the first time to locate schools of these fish. Industry spokesmen responsible for the development were expecting much greater production from the new venture. Florida normally produces practically all the mackerel in the Gulf since the vast resources around the mouth of the Mississippi and off Texas have never been exploited. The king mackerel run got off to a slow start because of cold weather, but the late run proved to be an excellent one, and prices held up well.

The menhaden industry experienced a good year. The fish were present in large numbers in areas where they could be easily taken, and the weather for the most part was favorable to fishing. The industry began the year with the threat of heavy imports and considerable carry over from the previous year; however, fish were plentiful and production in June, July, and August--the peak of the season--was considerably greater than the previous year. The extremely close margin on which the industry operated during 1960 forced economies in both the shore establishments and the vessel operations. The crews on the vessels were reduced substantially during 1960 by the use of the power block. As an example, in Louisiana, the number of vessels increased by 7 while the number of crewmen increased by only one man over the previous year. Less demand for solubles caused some of the firms to add solubles to meal. Imports did not materialize, but the constant threat kept prices of meal and oil at lower levels.

Oyster landings increased by more than 2 million pounds or 17 percent compared with 1959. Because of mortality of oysters in the Middle Atlantic States there was more demand for Gulf oysters. Texas reefs again produced a bumper crop as production in that State soared to near record highs. Landings at Texas ports were 63 percent greater in 1960 than in 1959. Improved condition of the reefs and a general improvement in the hydrological conditions along the Texas Coast accounted for some of the increase. Greater effort by fishermen was also a contributing factor. For example, Louisiana fishermen who for many years had not found it profitable to fish Texas oysters once again operated on Texas reefs.

Conditions in Louisiana were not so good despite the fact that Louisiana led all other Gulf States in oyster production. Cannerymen did not take large quantities of the native oysters for canning and some of the late planted reefs did not mature in time to catch the raw market, thus the decline in volume. A 14-percent decrease in the quantity canned was caused chiefly by heavy imports of canned oysters which reduced the prices for the domestic stock, and to some extent by heavy carryovers from the previous year's operations.

In Alabama and the West Coast of Florida production increased to such an extent that prices declined. Most of the price reductions occurred late in the season when production was at its height, thus seriously affecting the economy of many communities. Despite the lowered prices to the fishermen in these two States, the prices for snucked fresh oysters held up very well. Lessened competition from eastern areas and the proximity to the markets were believed responsible.

Landings of blue crabs on the Gulf Coast during 1960 rose 21 percent. Chiefly responsible for the increase was the heavier catch along the West Coast of Florida where landings totaled 18.7 million pounds, up 4.8 million pounds compared with the previous year. Texas landings of 2.9 million pounds were more than double the previous year's production. Utilization of crab meat in such speciality items as stuffed shrimp and crabs contributed to the increased production. Despite the much heavier landings, prices held fairly stable throughout most of the year. There was a slight decrease in fishermen's prices in Florida and also in Texas, but the price of cooked, picked crab meat was up in Texas despite the increased production.

GULF FISHERIES

The spiny lobster fishery in the lower Florida peninsula was seriously disrupted by hurricane Donna. The result was heavy losses of gear and fishing time, thus reducing the landings by 19 percent. Prices increased almost 9 cents over the previous year. Decreased landings as the winter tourist season opened contributed to a stable market and the advanced price.

Fishery research continued to expand in the Gulf area during 1960. The National Institute of Health granted \$104,000 to the University of Texas, and the National Science Foundation, \$51,000 to the same University for studies in the field of Marine Science. The Director of the University's Institute of Marine Science indicated that the investigation would be centered around determining the potential of the resources of Texas beach and bay waters.

The State of Texas Marine Laboratory at Rockport carried on rather extensive investigations into the movement of shrimp along the Texas Coast through a staining program. Their oyster investigations in Galveston Bay were expanded during the year.

Louisiana began a rather ambitious research program on both oysters and shrimp. The new laboratory at Island Terre completed in 1960 appeared destined to become one of the great marine research centers of the Gulf. Staining programs on shrimp were carried out east and west of the Mississippi River. On the west side the evidence was rather conclusive that shrimp move in a southwesterly direction from the bays. East of the Mississippi River results were somewhat inconclusive.

In the field of oyster research, the State mainly devoted its efforts to the collection of hydrographic data and to studies of the oyster drill.

The Gulf Coast Research Laboratory at Ocean Springs, Mississippi, a division of the Institution of High Learning in Mississippi, completed a study on the menhaden fishery during 1960. The study showed conclusively that few fish other than menhaden are taken in purse seines, and of these, mullet appeared more often than any other. This resulted when sets were made on schools of mullet mistaken for menhaden.

A program for bedding 80,000 barrels of oyster shells was carried out in Mississippi during the year. The oysters were towed to the bedding grounds on barges and unloaded by water pressure. This was the first oyster shell planting in Mississippi in several years. Other studies by the State included tests to determine the effect of dredging operations on oyster reefs in Pascagoula and Biloxi Bays.

The Florida State Board of Conservation continued its rather broad research program on many segments of its marine fisheries. The Laboratory at St. Petersburg carried on extensive research on shrimp as did the Marine Laboratory of the University of Miami.

Efforts of a major union to organize shrimp fishermen of the lower Texas Coast failed as a result of a ruling of the National Labor Relations Board. The Board, which held hearings on the matter during the spring months at Brownsville, Texas, ruled that trawler captains were independent contractors and that fishermen were, therefore, not employees of the boat owner.

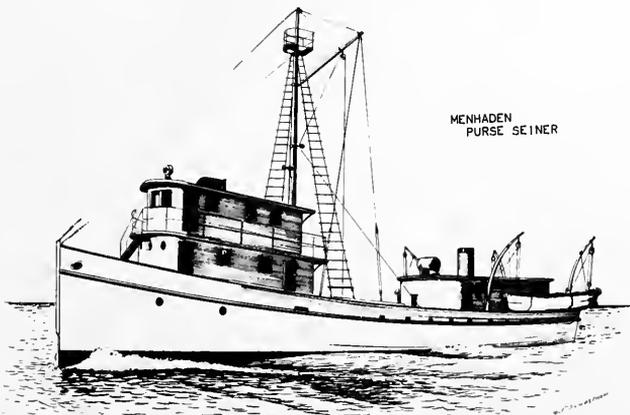

The Bureau of Commercial Fisheries continued its broad research program on fisheries of the Gulf. The Biological Laboratory at Galveston continued its studies of migration of shrimp and conducted an analysis of the biometrics of the shrimp fishery.

The Bureau's Technological Laboratory at Pascagoula, Mississippi continued the study of the composition of industrial fish for oil, moisture, and ash content by species. A shucking device for removing the meat from the shell of the calico scallop was developed. Laboratory personnel did considerable work on the development of standards for shrimp products which could be used by the industry. A method of canning sea bobs was perfected using fresh lemon juice concentrate. It was determined that iron from the can in which the sea bobs were canned tended to unite with the sulphite in the shrimp causing a black spot on the canned item rendering it unsightly to the consumer. Use of the lemon juice concentrate prevents this formation of the spot.

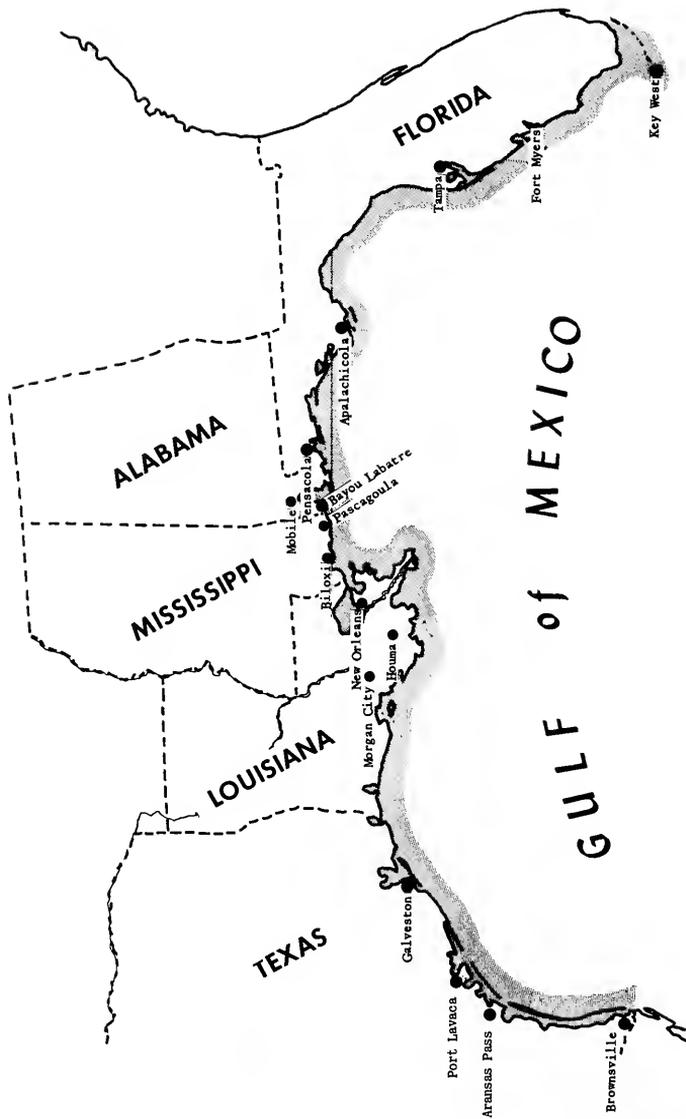

The only major legislative change in the Gulf during 1960 occurred in Mississippi where the Legislature abolished the Mississippi Seafood Commission and created in its place the Mississippi Marine Conservation Commission. Proposals were introduced in both Florida and Texas for reorganization of the conservation agency, but no definite action had been taken at the year's end.

Condensed summary data on operating units and catch by States appearing on the following pages have been previously published in Current Fishery Statistics bulletin No. 2694. Data on the catch and operating units of the East Coast of Florida and the entire State of Florida may be found in Section 5 of this Digest. Seasonal variations of the catch of fish and shellfish in Florida, Alabama, Mississippi, Louisiana, and Texas can be ascertained from monthly landing bulletins issued currently for these States in cooperation with the fishery agencies of each State. Additional aspects of the Gulf fisheries may be found in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, Federal Building, 600 South Street, New Orleans 12, Louisiana.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this Section: Florida State Board of Conservation; Marine Laboratory, University of Miami; Alabama Department of Conservation, Commercial Seafoods Division; Mississippi Marine Conservation Commission; Louisiana Wild Life and Fisheries Commission; and Texas Game and Fish Commission.

GULF SHRIMP FISHERY

Detailed statistics on landings of shrimp by United States craft at Gulf of Mexico ports were collected during 1960 for the fifth consecutive year. The data summarized on a monthly basis in the following tabulations include information on species by size; volume and value landed in each State; the number of fishing trips; days fished; and the catch by area, depth, and size of shrimp. Catch figures represent the heads-off weight and, therefore, are not directly comparable with the heads-on (live-weight) quantities published in the General Review, regional tables, or the Review of Certain Major Fisheries. The pounds of heads-off shrimp may be converted to a heads-on weight by multiplying by 1.68.

Landings at Gulf of Mexico ports in 1960 totaled 122.5 million pounds (heads-off) with a dock-side value of \$57.6 million to the fishermen. Compared with 1959, this was an increase of 6 percent in volume and 14 percent in value. Prices were up in all size categories except the under 15 count size which remained unchanged from the previous year. The greatest increase was in the 26 to 30 and 31 to 40 count size.

The economy of the shrimp fishery showed some gains in 1960 over the previous year when many fishermen had suffered disastrous losses. Larger catches were taken in the Sanibel-Tortugas area where fewer trips yielded a 77-percent increase in volume. However, although larger catches were also taken off the Texas Coast, in the Apalachicola area, and off Louisiana; greater fishing effort was required to make the catches. During the year, a few craft were rigged with three trawls as an experimental attempt to increase the yield.

Fishing effort on the high seas off the Mexican Coast west of 94° declined as did the catch; however, fewer trips yielded more shrimp in the Campeche area.

Three varieties of shrimp made up the bulk of the catch: Brown (*Penaeus aztecus*), 54 percent; pink (*Penaeus duorarum*), 22 percent; and white (*Penaeus setiferus*), 23 percent. The catch of sea bobs (*Xiphopenaeus kroyeri*) accounted for only 1 percent.

Fishing craft using shrimp otter trawls and operating out of United States ports along the Gulf of Mexico completed 181,120 trips and fished 186,526 24-hour days during 1960. Compared with 1959, this was a 7-percent increase in the total number of trips and a 6-percent increase in the number of 24-hour days fished.

Information on the landings and catch of shrimp in the Gulf area contained in the following tables has been previously published in Current Fishery Statistics No. 2604. Monthly data on the landings and value of shrimp by variety and size for the South Atlantic States are included in Section 5 of this Digest.

NOTE:--ALL WEIGHTS ARE ON HEADS-OFF BASIS. THE SIZE INDICATES THE NUMBER OF HEADS-OFF SHRIMP TO THE POUND. TO CONVERT TO HEADS-ON MULTIPLY BY 1.68 FOR BROWN, PINK, WHITE, AND SEA BOBS; FOR ROYAL RED, MULTIPLY BY 1.80. THE AREAS LISTED REPRESENT THE STATES WHERE THE SHRIMP WERE LANDED REGARDLESS OF WHERE CAUGHT. THE NAMES OF THE SPECIES USED IN THESE TABLES ARE AS FOLLOWS: WHITE SHRIMP (MOSTLY PENAEUS SETIFERUS), BROWN SHRIMP (PENAEUS AZTECUS), AND IN SOME CASES PENAEUS BRASILIENSIS. PINK SHRIMP (PENAEUS DUODARUM). SEA BOBS (MOSTLY XIPHOPEUS KROYERI), AND ROYAL RED SHRIMP (HYMENOPENAEUS ROBUSTUS), WHICH IS A DEEP-WATER SPECIES. THE VALUE REPORTED IS THE AMOUNT RECEIVED BY THE OWNERS OR OPERATORS OF THE VESSEL FOR THE FIRST SALE AT THE DOCK. ANY EXPENSES INVOLVED IN HANDLING OR PROCESSING ASHORE ARE NOT INCLUDED, EVEN THOUGH CHARGEABLE TO THE VESSEL. THE SIZE REPORTED GENERALLY IS THAT USED AS OF THE FIRST SALE. SIZE GRADING IN VARYING DEGREES OF UNIFORMITY MAY OR MAY NOT OCCUR AT, OR PRIOR TO, THE TIME FIRST SALES ARE MADE. IF GRADING IS NOT DONE AT THIS TIME, THE SIZE REPORTED IS AN AVERAGE SIZE AND MAY INCLUDE SEVERAL SIZE CLASSIFICATIONS.

NOTE: THESE DATA REPRESENT THE CATCHES OF VESSELS COMPLETING TRIPS DURING THE YEAR. REGARDS OF VESSEL LANDINGS OCCURRED. CONSEQUENTLY, THE DATA ARE NOT DIRECTLY COMPARABLE WITH THOSE PRESENTED IN THE TABLE WHICH REPRESENT LANDINGS A SINGLE TRIP IS SHOWN FOR EACH VOYAGE. ACTUAL FISHING TIME IN HOURS MAY BE DETERMINED BY MULTIPLYING THE NUMBER OF DAYS BY 24. ADDITIONAL TABULATIONS CONCERNING THE GULF OF MEXICO CATCH OF SHRIMP IN MORE DETAIL BY AREA, DEPTH, SIZE, AND FISHING EFFORT MAY BE OBTAINED UPON REQUEST FROM THE BUREAU OF COMMERCIAL FISHERIES, U.S. FISH AND WILDLIFE SERVICE, WASHINGTON 25, D.C.

SEE NOTE ON PAGE 310.

314 **SECTION 7 - PACIFIC COAST FISHERIES**

The yield of the commercial fisheries of the Pacific Coast States (Alaska, Washington, Oregon, and California) in 1960 amounted to 1.1 billion pounds valued at \$112 million. Landings were 6 million pounds and \$8 million larger than in 1959. There were substantial increases in landings of jack mackerel, salmon, tuna, and king crabs; and slight increases in the catches of "sole" (flounders), ocean perch, and sablefish. Landings of cod, sea herring, Pacific sardines, shrimp, and squid were considerably smaller than in 1959. Production of anchovies, halibut, oysters, and whale products was also less than in the previous year.

The Pacific Coast accounted for 21 percent of the volume and 32 percent of the value of the 1960 United States landings. It was second only to the Gulf Coast in quantity and led all other areas in value.

California was first in production on the West Coast with a catch of 541 million pounds (51 percent) worth \$50 million (44 percent). Alaska (358 million pounds valued at \$41 million) was second with 34 percent of the volume and 37 percent of the value. Washington, with landings of 113 million pounds valued at \$15 million, was third. Oregon accounted for the remaining 49 million pounds and \$6 million.

There were 31,439 fishermen engaged in Pacific Coast fisheries in 1960. Fishing craft consisted of 4,769 vessels of 5 net tons and over, 8,764 motor boats, and 2,132 other boats and accessory craft. The fishing craft ranged from small one-man boats to large tuna purse seiners.

Fishery products taken on the high seas off coasts of foreign countries by Pacific Coast fishermen amounted to about 288 million pounds or 27 percent of the total catch. Tuna taken off Central and South America accounted for 85 percent of this production. Other important species were bottomfish, halibut, and salmon taken off British Columbia. Pacific Coast fishermen ranged further than those of any other area in their quest for fish in 1960, operating from Bering Sea in the North to the waters off Peru.

Wholesale and manufacturing fishery firms operated in the Pacific Coast States in 1960 numbered 515--a few less than in the previous year. The firms gave employment to 24,000 persons. Manufactured fishery products produced were valued at over \$313 million--about \$17 million more than in 1959.

Production of packaged fishery products (fillets, steaks, portions, sticks, shellfish items, etc.) increased 1.7 million pounds, and the value was up \$2.4 million. Fish meal production was about the same as in 1959; oil and solubles were manufactured in lesser amounts. The total pack of canned fishery products amounted to 20 million cases valued at \$262 million--about 468,000 cases and \$18 million above the 1959 production. Production of canned tuna, salmon, mackerel, crab meat, and fish for animal food and bait was higher than in 1959. Sardines, oysters, and shrimp were produced at lower levels.

The Pacific Coast tuna fishery had a better year than in 1959, making a remarkable recovery from the chaotic conditions of previous years. Landings increased from 268 million pounds in 1959 to 288 million pounds in 1960. Catches of yellowfin were higher while the volume of albacore, bluefin, and skipjack was less. About 86 percent of the volume and 83 percent of the value was derived from fish taken in waters off foreign countries. Nearly all the skipjack and yellowfin came from this source, while albacore and about half of the bluefin were taken from waters off the United States.

Outstanding in the economic recovery of the tuna industry was the spectacular success of clippers converted to seines. At the end of 1960, there were 67 active vessels in the fleet compared with 15 a year earlier. Tuna seiners demonstrated both efficiency and economy by taking

larger catches in less than half the time required by tuna clippers. The converted vessels made trips averaging 4 to 6 weeks. In past years, as clippers, they were at sea for 10 to 14 weeks. Their success was reflected in reduced operating costs; the fish were sold at lower but profitable prices.

Processors (canners) were also better off in 1960 than in 1959. There were few price disputes, labor difficulties, or fleet tieups. A good supply of prime domestic tuna (mostly yellowfin) was available at lower prices, creating an increased demand for domestic fish. Imports of frozen tuna, loins and discs, and canned tuna were less than in 1959. The United States consumption of canned tuna, stimulated by intensive advertising and promotion, continued to grow. The 1960 United States pack of tuna reached a record 15.3 million cases valued at \$173 million.

Albacore fishing off the Coasts of Oregon and Washington in 1960 was only 38 percent as productive as in 1959. Landings dropped sharply from 14 million pounds in 1959 to about 5 million pounds in 1960. In spite of the relative scarcity of albacore in the North, prices paid fishermen were less than in the previous year.

In California, the story was different. The albacore catch (35 million pounds) was 7 percent above that of 1959 and could have been larger. A general albacore fleet tieup in California during July proved costly. Reports indicated that large schools of albacore were in nearby southern California waters during that period.

It was noted that in 1960 the albacore fishery shifted to southern California offshore waters early in July, in contrast to 1958 and 1959 when the fish moved toward Pacific Northwest waters. Albacore were also taken in Northern Mexican offshore waters, the first significant return of these fish to this area since 1957.

The 1960 Pacific salmon catch totaled 235 million pounds valued at \$45 million--much better than in 1959 when 202 million pounds valued at \$36 million were landed. However, only in Western and Central Alaska was the season really successful. Alaska's catch (207 million pounds valued at \$34 million) was up 40 percent in volume and 60 percent in value. In Oregon, production was about the same as in the previous year. Washington and California landings were well below those of 1959. Some areas approached near failure. The 1960 pack of canned salmon increased from 2.5 million cases in 1959 to 2.8 million cases. Alaska showed a gain of 793,000 cases, while the pack in Washington, Oregon, and California was down 424,000 cases.

Red salmon returned to Bristol Bay, Alaska, in near record numbers in 1960. The total run was estimated at well over 35 million fish. It produced a catch of about 13.5 million fish, of which almost 10 million were taken in the Naknek-Kvichak area. Over 20 million fish (perhaps a new record) escaped capture and reached spawning grounds.

One major factor in the exceptionally large escapement was the small size of fish (4.8 pounds average). During the early season, many escaped the 5-1/2 inch mesh gill nets. About the middle of July, the State of Alaska lifted almost all regulations (pink salmon nets of 4-1/2 inch mesh became legal) in Bristol Bay salmon fishing. Almost 10 million fish had been caught when restrictions were lifted. At times during the season, catches were too large for canneries to handle. Limits were set by firms, and fishing stopped until cannery crews caught up.

The heavy red salmon run caused a modest revival of Alaska's freezer ship fishery on Bristol Bay. In 1959 and 1958, the fleet was almost inoperative in Alaska. In 1960, more than 2 million pounds of salmon were delivered to Seattle by 5 vessels. However, not all of this cargo was canned at Seattle or on Puget Sound. Some was sold to Japanese interests.

PACIFIC COAST FISHERIES

Central Alaska salmon fishing along the Alaska Peninsula, off Kodiak Island, and in Cook Inlet, was better than expected in 1960. But in Prince William Sound, following a year of no operations, fishing was poor. In other areas (Southeastern Alaska, Washington, Oregon, and California) all species were scarce and the season approached disaster. There was a highly disappointing silver salmon season both offshore and on Puget Sound, and the troll fishing for king salmon yielded only 785,000 pounds compared with the low 1959 season of about 1.9 million pounds. The area had the lowest catch of chum salmon in many years, and in British Columbia, chums were also scarce. This affected the usual annual exports to the United States. A poor run of red salmon to the Fraser River had been expected, and the catch was only a little better than anticipated. Frequent closings and openings in the Puget Sound fall salmon fishing season caused discouragement to local fishermen. Receipts of salmon (fresh and frozen) at Seattle, Washington, were at an alltime low in 1960.

The halibut fishery of the United States and Canada in the northeastern Pacific Ocean and Bering Sea is managed by the International Pacific Halibut Commission. Under regulations, the fishery which had declined to an unprofitable state has been restored to a highly profitable condition. The total catch in 1960 was 71.9 million pounds (landed weight), the highest ever taken and well above the 44.2 million pounds taken in 1931, the year immediately prior to regulations. In 1960, United States fishermen took 38.3 million pounds or 53 percent of the total catch. Canada continued its growth trend, taking the largest catch in the history of its participation in the fishery.

There was a decrease in the catch from Areas 3A and 3B in spite of a larger fleet, while an increased catch was taken from Areas 2A, 2B, and 2C with a smaller fleet. To westward (Bering Sea), the decline in catch was due chiefly to poorer fishing. United States operations, resulting from the voluntary stay-in-port rules, reacted against Alaska port deliveries and favored those to British Columbia. There was an increase in landings of American fish at Prince Rupert. Halibut prices paid to fishermen in 1960 were below those paid the previous year.

The depressed condition of the world market for fish meal was reflected in the Pacific Coast herring fishery. The catch was down 31 million pounds--from 115 million pounds in 1959 to about 84 million pounds in 1960. Most of the catch was taken in Alaskan waters. In Prince William Sound and the Kodiak Island area, few limitations were imposed and regulations were unusually liberal in Southeastern Alaska. Although the 1960 catch was lower and prices paid to fishermen were less than in 1959, the domestic industry was in better condition than that of neighboring British Columbia. There, the fishery was crippled by price disputes and fleet tieups.

The 1960 California sardine season was another dismal failure. The catch dropped from 74 million pounds in 1959 to only 58 million pounds in 1960. It was the fourth smallest catch taken since 1915. There was no lack of fishing effort, and weather did not limit fishing activities. Sardines just failed to appear in appreciable quantities--catches were spotty and light in normal fishing areas. High surface water temperatures were believed, at least partially, to be the cause for poor snowings of sardines during most of the season. Only a few thousand cases of sardines were packed in San Francisco, and most of the fish canned in Monterey was trucked from southern ports. Almost all the 1960 pack, the lowest since 1957, was processed in southern California.

The 1960 catch of jack mackerel (75 million pounds) was 37 million pounds greater than the 1959 catch. Pacific mackerel (37 million pounds) was taken in about the same amounts as in the previous year. Lacking sardines in consistent quantity during the fall months of the year, seiners took substantial quantities of mackerel. Cannery requirements for jack mackerel were stimulated by the poor sardine season.

PACIFIC COAST FISHERIES

317

Landings of anchovies were down from 7 million pounds in 1959 to 5 million pounds in 1960. The canned pack, although larger than in 1959, was the second lowest since 1949. A large percentage of the catch was used in the pack of canned pet food. The reason for the small catch and canned pack was a lack of demand for canned anchovies. Due to the anchovies' small size and soft texture, it is difficult and costly to produce a good pack. Anchovies are packed primarily for export. However, other countries were producing this product at lower costs than in California. The catch of anchovies could be greatly increased if a better market demand were developed.

The catch of Pacific Coast shrimp was down sharply in 1960. Landings totaled only 12 million pounds--8 million pounds less than in 1959. Canned shrimp processors experienced serious setbacks. The 1960 pack (79,000 cases) was less than half the 169,000-case pack of the previous year. With the expansion of the commercial production of small Pacific shrimp, the industry realized that markets other than those for the canned product were needed. One large enough to absorb the potential production is the frozen market.

The 1960 catch of crabs off the Pacific Coast totaled 65 million pounds--nearly 9 million pounds more than in 1959. Rock crab production in California and total Pacific Coast Dungeness crab landings remained at about the same level as in the previous year. The gain was all in king crab fishing in Alaska. Catches increased from 19 million pounds in 1959 to 29 million pounds in 1960. The canned pack of this product increased by an astonishing 81 percent (1959--55,316 cases; 1960--100,105 cases). Three major factors were credited with the growth of this industry: (1) Discovery of new fishing grounds and excellent fishing on the usual grounds were experienced by the crab fleet in 1960; (2) the number of crab canneries increased; (3) there was a growing consumer acceptance of king crab products, and the market was expanded over wide areas of the United States.

In 1960, the Soviet Union and Japan greatly increased the intensity of their exploitation of the king crab population in the Bering Sea off Alaska. These nations had large numbers of efficient vessels engaged in the fishery for a period of several months. Full extent of the Japanese and Russian fishing operations was not known; but they appeared to have little difficulty in securing their catch.

A total of 271 whales was taken in 1960 by five catcher vessels operated by two whaling stations located in San Francisco Bay. This was a few less than were taken in 1959. Whale products, amounting to 10.3 million pounds, were manufactured from the catch. Both whaling companies operated primarily to obtain whale meat. Much of this was ground, packed in 50-pound bags, and frozen for sale to milk ranches. Large amounts were also sold for use in canned pet food. Due to a steadily increasing demand, the price of meat remained high. An additional plant licensed to operate a station at the mouth of the Columbia River was not active during the 1960 season.

Trawling for groundfish in waters off the Pacific Northwest received impetus with the discovery of new fishing areas by the Bureau's John N. Cobb in 1960. Using high-resolution echo sounders and refined exploratory techniques, the vessel located four new areas off Washington where ocean bottoms are favorable for dragging. Commercial quantities of petrale sole, Dover sole, and Pacific ocean perch were present in these areas. The grounds were surrounded by areas of rough bottom. A fifth area--60 square miles in extent--was discovered off British Columbia. Once the grounds were delineated, trawlers were able to fish them through careful use of echo sounders.

PACIFIC COAST FISHERIES

Good shrimp trawling grounds were found in waters off Oregon by biologists aboard the Bureau's research vessel during cooperative exploratory fishing by the Bureau and the Oregon Fish Commission. Trawling produced fair-size shrimp at a depth of from 90 to 105 fathoms. The area's bottom was reported to be soft and free of rocks.

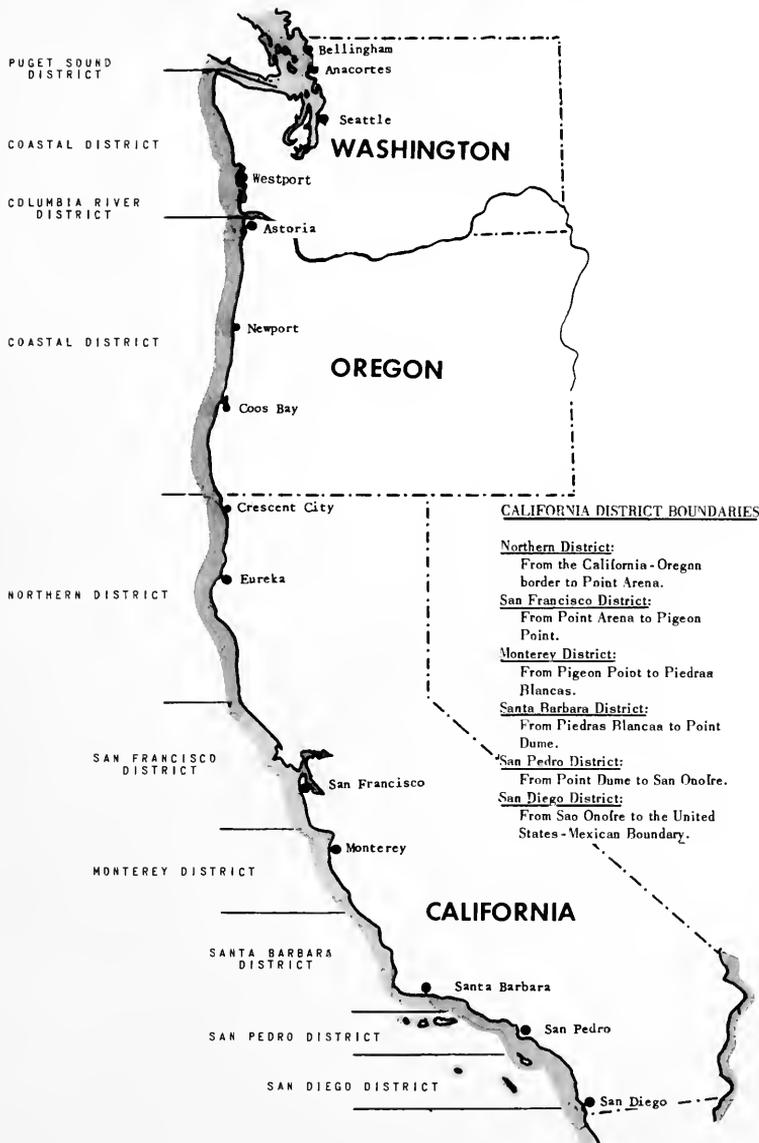

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The Washington Department of Fisheries, the Oregon Fish Commission, the California Department of Fish and Game, and the Alaska Department of Fish and Game.

Condensed summary data on the operating units and catch by States for the Pacific Coast fisheries appearing on the following pages have been previously published in Current Fishery Statistics No. 2795. Additional data on many aspects of the Pacific Coast fisheries may be found in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service offices in San Pedro, California, and Seattle, Washington. Specific data on several of the major fisheries of the Pacific Coast may be found in Section 12 of this publication.

1/ INCLUDES THE VALUE OF HALIBUT LIVERS AND VISCERA AMOUNTING TO \$17,920.

2/ INCLUDES THE VALUE OF SABLEFISH LIVERS AMOUNTING TO \$119.

3/ ESTIMATED WEIGHTS OF SALMON WERE DETERMINED FOR EACH REGION. THESE WEIGHTS WERE USED TO CONVERT NUMBER OF SALMON TO POUNDS.

NOTE:--THE ABOVE DATA INCLUDE CATCHES OF HALIBUT, SABLEFISH, LINGCOD, AND ROCKFISHES LANDED BY VESSELS OF U. S. REGISTRY IN BRITISH COLUMBIA PORTS. ROUND WEIGHTS OF FISH TAKEN BY HALIBUT VESSELS WERE OBTAINED BY MULTIPLYING REPORTED WEIGHTS, REPRESENTING POUNDAGE OF FISH Eviscerated AND WITH HEADS-OFF, BY THE FOLLOWING FACTORS: HALIBUT 1.33, AND SABLEFISH, LINGCOD, AND ROCKFISHES 1.43.

PACIFIC COAST FISHERIES

LANDINGS BY HALIBUT FLEET AT SEATTLE, WASHINGTON

Landings of halibut at Seattle, Washington during 1960 by the United States halibut fleet amounted to 15.7 million pounds valued at \$2.9 million--a decline from 1959 of 1.5 million pounds or 9 percent, and \$800,000 or 22 percent.

Landings of halibut from fishing grounds west of Cape Spencer decreased 1.2 million pounds compared with 1959. Landings of sablefish from grounds south of Cape Spencer amounted to 2.7 million pounds--900,000 pounds more than in 1959.

The following tables contain a summary of the landings of dressed halibut at Seattle by the United States halibut fleet. These data are not directly comparable with the State and sectional tables showing the round weight of fish landed. For additional information on the Pacific Coast halibut fishery, the reader is referred to Section 11 of this publication, Review of Certain Major Fisheries.

1/ LESS THAN \$500.

NOTE:--THE 1960 HALIBUT FISHING SEASON OPENED ON APRIL 1, IN AREA 3B ONLY, (WATERS WEST OF AREA 3A INCLUDING THE BERING SEA) AND ON MAY 1, IN ALL OTHER AREAS; AREA 1A (SOUTH OF HECETA HOOD IN OREGON), AREA 1B (BETWEEN HECETA HOOD AND WILLAPA BAY IN WASHINGTON), AREA 2 (BETWEEN WILLAPA BAY AND CAPE SPENCER, ALASKA), AND AREA 3A (BETWEEN CAPE SPENCER AND SHUMAGIN ISLANDS, ALASKA). ALL AREAS OPENED OR CLOSED AT 6 A.M. PACIFIC STANDARD TIME. THE FIRST SEASON IN AREA 2 AND 1B CLOSED ON JULY 31, AND OPENED AGAIN ON SEPTEMBER 11, WITH A 7-DAY NO CATCH LIMIT SEASON. AREA 3A CLOSED TO HALIBUT FISHING ON JULY 29, AND REMAINED CLOSED. AREA 3B CLOSED TO REGULAR HALIBUT FISHING ON OCTOBER 16.

WHALING

A total of 271 whales was taken off California in 1960--38 less than in 1959. The catch was processed into 3 million pounds of whale meal, 4 million pounds of whale meat, and 3.3 million pounds of sperm and whale oil. These products were valued at \$672,000 to the processors. Compared with the previous year, this was a decrease of 10 percent in volume and 23 percent in value.

The whales were captured by five harpoon vessels. They operated largely within a 100-mile radius of the two shore stations at Point San Pablo on San Francisco Bay. When the 1960 season opened on April 16 (15 days ahead of previous seasons), it was believed that more daylight hours and better weather early in the season would permit a higher catch. Unfortunately, a combination of bad weather and a scarcity of whales resulted in a low catch. The season closed on October 15 to comply with the International Convention for the Regulation of Whaling which limits shore stations to a consecutive 6-month season each year for baleen whales.

The 138 fin whales taken accounted for slightly more than one-half the 1960 catch. The remainder of the catch was composed of 1 blue, 2 bottlenose, 16 sperm, 47 sei, and 67 humpback whales. The catch of fin whales, the preferred species, was up considerably compared with the previous year, and the catch of sei whales was the highest since operations resumed in 1956.

The whaling companies operated primarily to obtain whale meat. This meat, when ground, was packed into 50-pound bags and frozen for sale to mink ranches. Large amounts were also sold for use in canned pet food. In 1960, due to a steadily increasing demand, the price of whale meat remained high.

PACIFIC COAST FISHERIES

FUR SEAL INDUSTRY OF THE PRIBILOF ISLANDS

A total of 40,616 sealskins was harvested on the Pribilof Islands in 1960, the smallest take for any year since 1929, except 1942, when sealing operations were suspended because of World War II. During the season which extended from June 27 to August 15, the take consisted of 36,320 male and 4,296 female skins compared with 30,176 male and 27,634 female skins harvested during the 1959 season.

It had been anticipated that the take of skins during 1960 would be below average. Although no dependable means of predicting the volume of 3-year-old males (the principal group taken) has been developed, indications supported an estimate that 25,000 to 45,000 would be available for killing. The low abundance of 3-year-olds in the 1959 kill indicated there would be a serious shortage in 1960 of 4-year-olds, which normally account for 40 percent of the take. In addition to the males, 17,500 cows were to be removed in a herd reduction program designed to increase survival of seals to commercial size by curtailing competition from overage animals and reducing other effects of overabundance.

By the end of the scheduled season on July 31, only 22,936 seals had been taken. Because the favored position of sealskins on the market was being jeopardized by protracted scarcity and since the abundance of 3-year-old bachelor seals on the hauling grounds kept progressively increasing beyond the normal season peak July 22-25, it was decided to continue the harvest until either the abundance of commercial-grade seals ceased climbing or 2-year-olds arrived in strength.

These plans never came to fruition, however, because of an unexpected early onset of staginess (a condition preliminary to moult) which lessens quality. Accordingly, the male kill on St. Paul Island was abruptly terminated after August 7, and after August 10 on St. George, where staginess appeared less advanced. In mid-July, plans for taking cows for herd reduction purposes were discontinued when it became clear that the desired lower abundance had been achieved through natural causes. However, to secure scientific information, 250 cows on St. Paul Island and 100 on St. George Island were killed each day after termination of the taking of males. All killing was discontinued after August 15.

Among general observations on features of the 1960 season were the following:

(1) The annual count of mature bulls, both idle and harem masters, was comparable to recent years. Thus, the number of harems had not decreased. Further indicating the ample reserve of male breeding stock was the noticeably large proportion of oversize males of all ages rejected from the drives each morning. This may have been partly an illusion resulting from the relatively smaller number of killable sizes present. However, it appeared evident that more males had been spared from the kill, over a period of many years, than has been necessary.

(2) The total areas occupied by harems on all rookeries were less than in previous seasons. Comparison of a series of 1960 photos with a set made in 1948 showed quite clearly smaller harem coverage. Female skins within the desired killable size range were noticeably scarce during the late-season research drives, which corresponded to the reduced abundance of 3- and 4-year-old males in recent years. It was evident that the average size of harems was below that of earlier years.

(3) The season, as measured by the availability of 3-year-old bachelors, was definitely later than the average.

(4) Pup mortality, which seems to be an inverse barometer of subsequent survival at sea, was counted at 62,828 on all St. Paul rookeries. This compares with 40,000 in 1959 and an average of 75,000 for the 6 previous years.

NOTE:--AGE WAS DETERMINED BY COUNTING GROWTH RIDGES ON CANINE TEETH OF A 10% SAMPLE OF KILLED ANIMALS. MEASUREMENTS ARE OVERALL LENGTHS TAKEN ON THE KILLING FIELD.

DISTRIBUTION OF TAKE OF SEALSKINS, 1960

The fur seal treaty specifies that Canada and Japan are to receive 15 percent each of the skins taken on the Pribilof Islands. To insure an impartial selection of their respective 15 percent, Canada made a random choice of numbers 7-13-19 and Japan, 2-4-6 out of each 20 barrels of sealskins. This resulted in the following allocation of skins to the United States, Canada, and Japan:

ITEM	UNITED STATES	CANADA	JAPAN	TOTAL
	NUMBER	NUMBER	NUMBER	NUMBER
MALE SKINS:

PACIFIC COAST FISHERIES

SALE OF SEALSKINS, 1960

Two public auctions of sealskins were held in St. Louis, Missouri, in 1960 where 50,771 skins were sold for the account of the United States Government. Gross receipts from the two auctions amounted to \$4.8 million. The offerings consisted of 44,433 conventionally processed skins which yielded \$4.6 million and 6,338 sheared skins which sold for \$228,464. These were the first sheared "Lakoda" skins offered for sale. The average price of less than \$36 per skin was far below the \$103 received for conventionally processed skins. An additional 40 conventionally processed and 44 sheared "Lakoda" skins were sold at private sales for promotional purposes. These yielded \$4,534 and \$1,741, respectively.

PRODUCTION OF FUR SEAL MEAL AND OIL, 1960

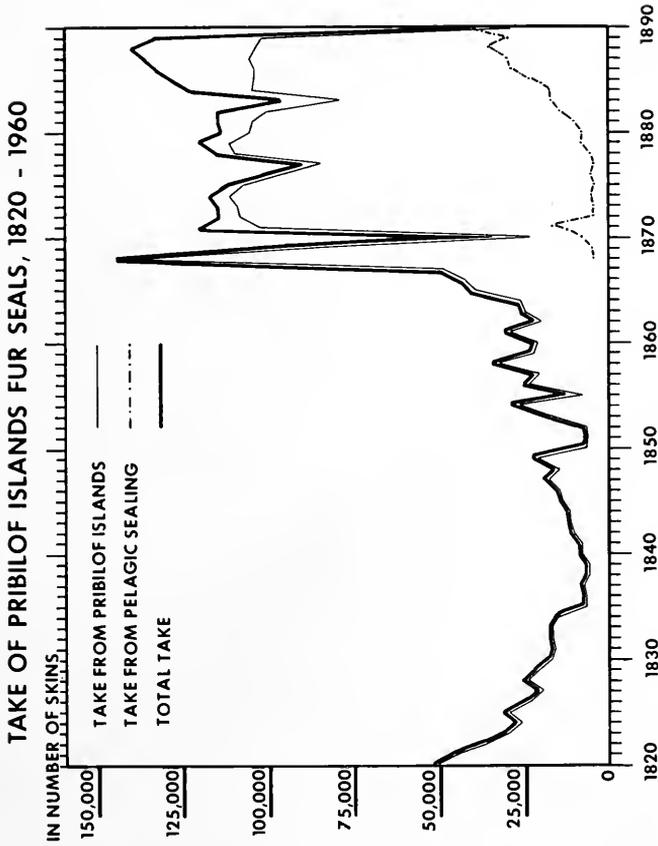

The operation of the reduction plant on St. Paul Island was terminated August 5 because of an equipment breakdown. A total of 26,026 carcasses was processed into meal and oil. In addition, 58 barrels of 55 pounds each of salted blubber were packed for the use of the Fouke Fur Company in treating sealskins.

PACIFIC COAST FISHERIES

The 1960 United States and Canadian commercial catch of fishery products in the Great Lakes, Lake St. Clair, and the International Lakes of northern Minnesota amounted to 110 million pounds. This was about 755,000 pounds more than in 1959. Domestic landings accounted for 62 percent of the landings.

United States fishermen took 68 million pounds of fish valued at over \$7 million from these lakes in 1960. The volume landed was 2.4 million pounds or 4 percent larger than in 1959, while the total value received by fishermen remained about the same.

Canadian landings (42 million pounds) were nearly 2 million pounds less. More than 46 percent of the United States-Canadian catch from these lakes was taken in Lake Erie, while 22 percent and 15 percent came from Lakes Michigan and Superior, respectively.

Landings of smelt, lake herring, and yellow perch declined sharply, while slighter decreases were noted in the production of lake trout and yellow pike. The 1960 harvest was bolstered by a large increase in the catch of chubs and alewives. Landings of catfish, sheepshead, suckers, white bass, and whitefish were above the amounts landed in 1959.

In 1960, Lake Michigan (24.3 million pounds) was the leading contributor to the United States' catch with 3.5 million pounds more than in the previous year. Lake Erie, the 1959 leader, yielded a catch of 21.3 million pounds--1.2 million pounds less than in 1959. Lake Superior landings were down 1.2 million pounds. Catches in other lakes were virtually unchanged from the previous year.

Michigan led other States in production with a catch of 25 million pounds--nearly 3 million pounds more than in 1959. Wisconsin (18.4 million pounds) was in second place, exceeding the previous year's catch by 1.6 million pounds. Ohio (18 million pounds) landings were down 1.5 million pounds.

In 1960, a total of 3,811 men, 498 vessels of 5 net tons and over, and 1,461 other craft was employed in the commercial fisheries of this area. The number of vessels dropped 13 from the previous year. As a result of the poor economic condition of the Great Lakes fisheries for a number of years, there has been a steady decline in the number of vessels operated on the Lakes. Since 1950, the number of vessels fishing has dropped from 661 to 498--a decrease of 163 craft or 25 percent.

The composition of stocks of fishes in the Great Lakes continued to change in favor of introduced species with little market value or demand. The alewife continued its expansion throughout the Lakes. This species was taken by commercial fishermen in Lake Superior for the first time in 1960. The change in composition is caused partly by the decimation of some native species by the lamprey, partly by selective fishing for the remaining high value species, and partly by changing physical conditions in the lakes which provided a more favorable habitat for less desirable fish. Because introduced species were able to reproduce in enormous numbers and feed on microscopic plants and animals, they are now present in greater volume than were the fish formerly predominant in these waters. Biologists believe the Great Lakes now contain a greater weight of fish than ever before in the history of the fishery.

An important Bureau accomplishment on the Great Lakes has been the encouragement of otter trawling to replace less efficient gear. In 1960, 21 vessels engaged in this fishery--a gain of 11 vessels over 1959. Trawling received more attention and was well on its way to becoming an accepted method of fishing. Large quantities of fish were produced that would not have been harvested if traditional fishing methods had been used. While most of the fish were low valued species and sold for animal food, some were suitable for human consumption.

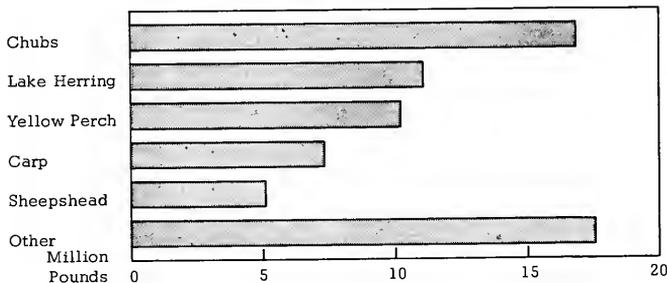

GREAT LAKES FISHERIES

The lamprey control program in Lake Superior was continued. The application of selective toxicants to the tributaries of this lake for the destruction of sea lamprey larvae was completed during 1960. The effectiveness of the treatments gave cause for optimism as to the success of chemical control. Operation of electrical barriers in selected tributary streams should give a measure of the reduction of sea lamprey stocks in Lake Superior. Effects of the treatment should be detectable in the 1961 spawning run; the 1962 records can be held conclusive. Lake Michigan streams are to begin undergoing treatment in 1961.

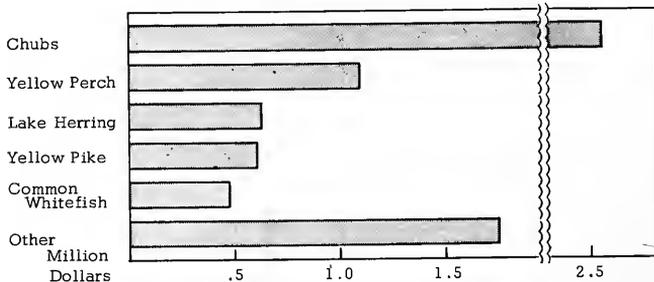

Much of the data in this section was assembled and prepared for publication by the Bureau's Branch of Statistics and Branch of Inland Fisheries from information collected by the following agencies: Dominion Bureau of Statistics of Canada; Illinois Department of Conservation; Indiana Department of Conservation, Division of Fish and Game; Michigan Department of Conservation; Minnesota Department of Conservation; New York Conservation Department, Division of Fish and Game; Ohio Department of Natural Resources, Division of Wildlife, Section of Fish Management; Pennsylvania Fish Commission; and Wisconsin Conservation Department.

Condensed summary data on the operating units and catch of the Great Lakes fisheries appearing on the following pages have previously been published in Current Fishery Statistics No. 2796. Seasonal variations in the catch of fish landed in Ohio can be ascertained from monthly landing bulletins issued currently in cooperation with the Ohio Department of Natural Resources, Section of Fish Management. Additional specific data on many aspects of the Great Lakes fisheries may be found in the daily, monthly, and annual reports published by the Bureau's Chicago Fishery Market News office.

SECTION 9 - MISSISSIPPI RIVER FISHERIES

The 1960 commercial catch of fish and shellfish from waters in the Mississippi River drainage area totaled 85.6 million pounds valued at \$7.8 million. Compared with 1959, this was an increase of 7.9 million pounds or 10 percent in volume and \$201,000 or 3 percent in value. The larger 1960 catch resulted from an increased mussel shell harvest in the States of Alabama and Tennessee.

Five items--buffalofish, carp, catfish, sheepshead, and mussel shells--accounted for 90 percent of the volume and 83 percent of the value of the 1960 catch. Although commercial fishing was conducted in 20 States in this area, 7 States accounted for 81 percent of both the volume and value. Alabama led, followed by Minnesota, Tennessee, Wisconsin, Louisiana, Illinois, and Arkansas. The Mississippi River and Tennessee River were the leading producing waters in 1960. Nearly 42 million pounds or 49 percent of the area's catch were taken from these rivers.

The unique fresh-water mussel fishery expanded operations in 1960. The volume landed was double that of the previous year, and fishermen received higher average prices. The large demand was created by Japanese culture pearl growers. Many of their oyster beds were destroyed by typhoons, and they turned to the mussel shell fishery for the shells to be used in making inserts for placement in oysters. It is around these inserts that cultured pearls grow. Domestic use of mussel shells continued to decline as additional button firms followed the trend to use of plastics. However, there was some demand for this item for use as poultry grit and colored chips for aquariums.

The nation's expanding industrial economy has changed the habitat where fresh-water fishermen take their catch. Many rivers have been dammed to create large lakes. Fishermen, however, adapted to these changes and are probably fishing more acres of water today than at the turn of the century. Recently, commercial fishermen have benefited as a result of actions by northern States to allow commercial fishing for rough fish in sport fishing waters. Biological investigations have shown that the removal of these species improves conditions for the growth of game fish.

Rough fish removal fisheries continued to expand in area to more western and mountain States. In 1960, 14 States with rough fish control were canvassed; several more States are believed to have this type of fishery, but have not been surveyed. Carp is the principal species controlled. In 1960, about 13 million pounds of carp from controlled fisheries were marketed. This amount was over one-half of all carp taken in inland waters.

Commercial fishing on the rivers is usually a part-time occupation. Early in this century, sport fishing became of sufficient importance to overshadow the commercial use of this fishery. As a result, the commercial fishermen lost the right to take certain fish for sale; in some areas commercial fishing methods were declared illegal; and fishing seasons and areas were denied commercial fishermen.

The statistics of the river fisheries have shown relatively little change over the years. The same species have always dominated the catch, and the same fishing gears have continued to be used. The total catch of fish has changed little. Although game fish were taken in the early fishery, they never made up a significant portion of the landings.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: Alabama Department of Conservation, Division of Game and Fish; Arkansas Game and Fish Commission; Illinois Department of Conservation; Indiana Department of Conservation; Iowa State Conservation Commission; Kansas Forestry, Fish and Game Commission; Kentucky Department of Fish and Wildlife Resources; Louisiana Wild Life and Fisheries Commission; Missouri State Conservation Commission; Montana State Fish and Game Commission; Nebraska

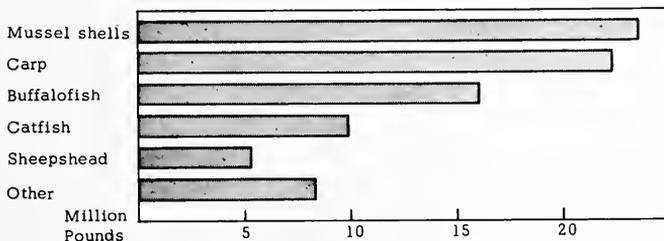

Game, Forestation, and Parks Commission; North Dakota State Game and Fish Department; Oklahoma Game and Fish Department; South Dakota Department of Game, Fish and Parks; Tennessee Game and Fish Commission; Texas Game and Fish Commission; Wisconsin Conservation Department; Wyoming Game and Fish Commission; and the Tennessee Valley Authority, Fish and Game Branch.

Condensed summary data on the operating units and catch by States of the Mississippi River fisheries appearing on the following pages have been previously published in Current Fishery Statistics No. 2802.

SECTION 10 - HAWAII FISHERIES

The 1960 landings of commercially caught fish and shellfish at ports in the State of Hawaii amounted to 11.1 million pounds valued at \$2.7 million to the fishermen. This was a decrease of 5.5 million pounds in volume and \$475,000 in value compared with the 1959 production. Reduced catches of skipjack tuna were responsible for the decline. The catch was taken by 598 fishermen. Fishing craft operated during the year included 63 vessels of 5 net tons and over, 193 motor boats, and 34 other boats. Except for minor improvements in vessels and gear, Hawaiian fishermen still fish as they did 40 years ago.

Fishery products were landed at six of the eight islands that form the newest State in the Union. The Island of Oahu ranked first in production accounting for nearly 9 million pounds or 77 percent of the total Hawaiian catch. The Island of Hawaii was in second place (1.4 million pounds) followed by Maui (872,000 pounds). Landings at Molokai, Kauai, and Lanai accounted for the remainder of the catch. Receipts of tuna (albacore, bigeye and bluefin, little, skipjack, and yellowfin) accounted for 81 percent of the volume and 64 percent of the value of all fishery products landed by Hawaiian fishermen.

Reports received from monitoring stations set up by the Honolulu Laboratory of the Bureau indicated that environmental conditions were not favorable for a good skipjack year. Cannery reports indicated that the landings in early and late summer of 1960 consisted mostly of small skipjack. Landings during the same period in 1959 were mostly large fish. This, coupled with a shortage of live bait during the height of the season, accounted largely for the poor skipjack season which resulted in a lower overall catch in Hawaii during 1960.

Hawaiian tuna fishermen have had a problem catching bait. They use an anchovy like fish called nehu and spend many hours hunting them. Experiments are now being conducted with tilapia which breeds prolifically, is harder than the nehu, and just as good for bait. Although the tilapia is not presently available in commercial quantities, the State has allotted \$130,000 for the construction of a tilapia hatchery and \$50,000 for its operation. Other experiments are being conducted with the Marquesan sardine and the threadfin shad.

During 1960, the Honolulu Laboratory tested a gill net made of monofilament nylon in hopes that it could be developed for skipjack fishing. Behavior studies of skipjack were conducted to better understand this species so that new fishing techniques and gear can be developed to harvest them more efficiently.

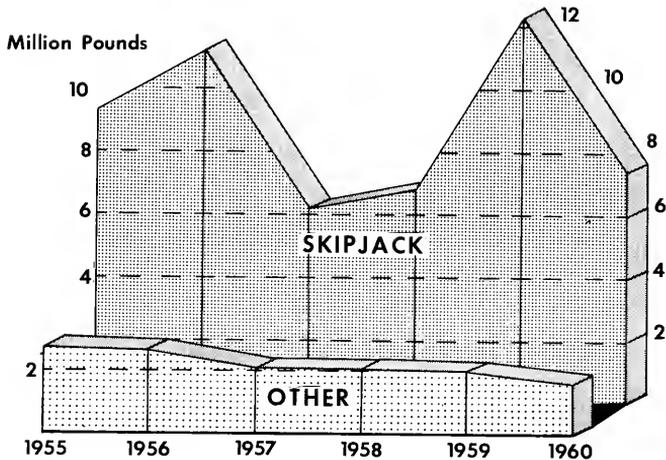

Data on the volume and value of the fisheries of Hawaii by months were published in Statistical Digests for the years 1946-1958. It was not until 1959, the year Hawaii became a State, that operating unit and catch data were assembled in approximately the same manner as those for other States so that the figures could be included in the national summary tables. Catch data for Hawaii are presented in two categories--the ocean catch and the pond (salt-water) catch. The common and scientific names of the species of fish and shellfish landed in Hawaii are not included in Section 14 of this report.

The data in this section were assembled and prepared for publication by the Bureau's area office, Honolulu, Hawaii, largely from information collected by the Hawaii Department of Land and Natural Resources, Division of Fish and Game.

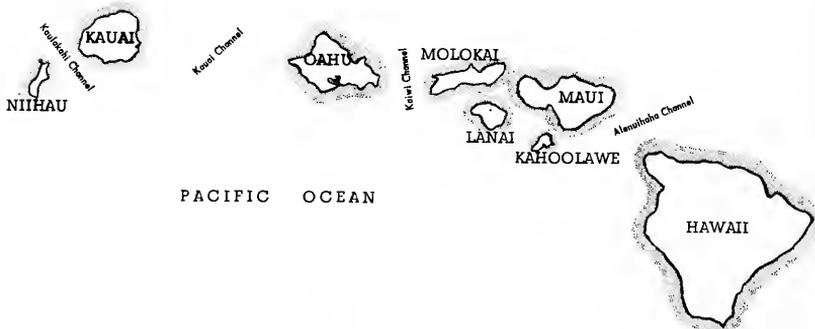

The following tables contain summarized and detailed information on the 1960 operating units and catch by islands of the State of Hawaii. Condensed summary data on the operating units and catch of the Hawaiian area, appearing on the following pages, have been previously published in Current Fishery Statistics No. 2724.

REVIEW OF CERTAIN MAJOR FISHERIES

There are presented in this Section of the Digest complete data on the catch of certain major species of fish and shellfish taken on a commercial scale in the United States. Additional information is presented on the operating units engaged in the menhaden purse seine, salmon troll, the shrimp and fish otter trawl, and the tuna fisheries. Although the data on catch are included in the detailed catch tables of the various States, they have been repeated in individual fishery tables in this portion of the report to provide readers with a single source of catch data for cod, haddock, halibut, Pacific mackerel, jack mackerel, menhaden, Atlantic ocean perch, Pacific sardines, salmon, tuna, oysters, clams, crabs, and shrimp. Most of the above species are taken by several types of fishing gear. Because of this, the casual reader of the Digest often experiences difficulty in locating complete data on the catch of the species in individual State catch tables. The information contained in this Section includes the volume and value of the catch by individual types of gear and by States and districts.

UNITED STATES COD FISHERY

United States fishermen landed 45.8 million pounds of cod valued at nearly \$3 million in 1960. This was a decrease of 14 million pounds or 24 percent in volume and \$1 million or 26 percent in value compared with the 1959 catch.

Otter trawls accounted for 78 percent of the catch; lines of all types, 17 percent; and gill nets, 4 percent. The remaining catch was taken in pound nets, floating traps, and dredges.

Landings at Massachusetts ports amounted to 31 million pounds and accounted for 68 percent of the total catch. Washington was second with 5 million pounds, followed by New Jersey (4 million pounds), and Maine (3 million pounds). The remaining catch was landed in 7 other Atlantic and Pacific Coast States.

ATLANTIC COAST HADDOCK FISHERY

The 1960 haddock fishery of the United States yielded a commercial catch of 118.7 million pounds valued at \$9.4 million. Compared with 1959, landings were up 6 million pounds or 5 percent. The value of the catch was down \$1.5 million or 14 percent. The average price paid for haddock declined from 9.7¢ per pound in 1959 to 7.9¢ in 1960. The heavier haddock catch in 1960 was due to a substantial increase in scrod landings. Large haddock landings were down. With little interruption, there has been a steady downward trend in the catch of large haddock from 1938 through 1960.

Landings of haddock at Massachusetts ports amounted to 114.6 million pounds during 1960, accounting for 97 percent of the total catch. The remaining poundage was landed at other ports in the New England and Middle Atlantic area.

Otter trawl catches accounted for 98 percent of the total haddock landings. The remaining 2 percent was taken with lines or in gill nets and dredges.

About 84 percent of the catch was taken from waters off New England. Georges Bank and South Channel yielded the greatest portion of the catch. Waters off Nova Scotia accounted for about 16 percent.

REVIEW OF CERTAIN MAJOR FISHERIES

PACIFIC COAST HALIBUT FISHERY

The halibut fishery of the United States and Canada in the Northeast Pacific Ocean and Bering Sea is managed by the International Pacific Halibut Commission. Under regulation, the fishery, which had declined to an unprofitable state, has been restored to a highly profitable condition. A review of this fishery entitled "Eastern Pacific Halibut Fishery, 1888-1960" appears in Section 12 of this report.

The total catch in 1960 by United States and Canadian fishermen amounted to 71.9 million pounds (landed weight). This was the highest ever taken and well above the 44.2 million pounds taken in 1931, the year immediately prior to regulation of the fishery. In 1960, United States fishermen took 38.3 million pounds or 53 percent of the total catch. Canada continued its growth trend taking the largest catch in the history of its participation in the fishery.

The 1960 halibut season opened April 1 in Area 3B, and on May 1 in all other areas. Fishing in Areas 1B and 2 was divided into two periods. The first season from May 1 to July 21, and the second, without a catch limit restriction, from September 11 to September 8. Area 3A closed on July 25, and Area 3B closed to regular halibut fishing on October 16. Areas 3A and 3B did not have split seasons during 1960.

Data on the landings of halibut in the following tables represent the dressed weight of fish, i. e., the weight by which the quota is determined. The dressed weight of halibut can be converted to round weight by multiplying by 1.33. In other tables of this report, halibut landed in Canada by vessels of United States registry is credited to Alaska.

1/ LESS THAN 500 POUNDS OR \$500.

NOTE:--IN ADDITION, THERE WERE APPROXIMATELY 59,000 POUNDS OF "NORTHERN" HALIBUT LANDED IN CALIFORNIA. MOST OF THIS CATCH WAS INCLUDED UNDER "CALIFORNIA HALIBUT" AND "UNCLASSIFIED FLOWNDERS". LANDINGS OF HALIBUT AND SABLEFISH LIVERS DURING 1960 AMOUNTED TO 90,690 POUNDS VALUED AT \$18,182. THE QUANTITIES SHOWN IN THE ABOVE TABLE REPRESENT DRESSED WEIGHT OF FISH. TO CONVERT TO ROUND WEIGHT, MULTIPLY THE WEIGHT OF HALIBUT BY 1.33 AND OTHER SPECIES BY 1.43.

TOTAL.	20,316	3,745	28,051	4,525	23,537	3,345	71,904	11,615

1/ IN ADDITION, THERE WERE APPROXIMATELY 59,000 POUNDS OF "NORTHERN" HALIBUT LANDED IN CALIFORNIA. MOST OF THIS CATCH WAS INCLUDED UNDER "CALIFORNIA HALIBUT" AND "UNCLASSIFIED FLOUNDERS".

NOTE:--STATISTICS IN THE ABOVE TABLE WERE COMPILED FROM DATA COLLECTED BY THE INTERNATIONAL PACIFIC HALIBUT COMMISSION FOR WASHINGTON, OREGON, AND BRITISH COLUMBIA, AND BY THE STATE OF ALASKA. QUANTITIES REPRESENT DRESSED WEIGHT OF THE FISH.

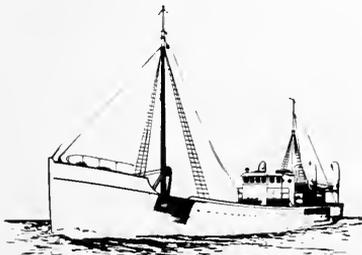

ATLANTIC OCEAN PERCH FISHERY

The catch of Atlantic ocean perch totaled 141.4 million pounds valued at \$5.4 million. This was an increase of 4.7 million pounds or 3 percent in volume. The value was down \$245,000 or 4 percent.

The entire catch was taken by otter trawls and landed in the States of Maine and Massachusetts. The Maine landings accounted for 78.3 million pounds or 55 percent of the catch and \$3 million or 56 percent of the value.

Nova Scotia banks were the principal fishing grounds for ocean perch in 1960. This area yielded about 80 million pounds or 57 percent of the total. Catches on the Grand Banks accounted for 33.6 million pounds or 24 percent. The remainder of the catch was taken off New England or in the Gulf of St. Lawrence.

The area's ocean perch fishery recovered slightly in 1960 from the 1959 low. The fleet operated at capacity. Gloucester trawlers turned more to Nova Scotia banks and away from the distant Gulf of St. Lawrence and Grand Banks which had supplied a large part of the catch through most of the 1950's.

OTTER TRAWLER USED IN OFFSHORE OCEAN PERCH FISHERY

REVIEW OF CERTAIN MAJOR FISHERIES

PACIFIC COAST SALMON FISHERY

The 1960 commercial salmon catch in the Pacific Coast States totaled 235 million pounds valued at \$45 million--much better than in 1959 when 202 million pounds valued at \$36 million were landed. However, only in western and central Alaska was the season really successful. The Alaska catch (207 million pounds valued at \$34 million) was up 41 percent in volume and 60 percent in value. In Oregon, the production was about the same as in the previous year. Washington and California landings were well below those of 1959.

Red salmon returned to Bristol Bay, Alaska, in near record numbers in 1960. The total run was estimated at well over 35 million fish. It produced a catch of about 13.5 million fish. Over 20 million fish, perhaps a new record, escaped capture and reached spawning grounds. Gill nets were the most important gear used in taking salmon in 1960, accounting for 122 million pounds or 52 percent of the total catch. Purse seines were in second place with 92 million pounds or 39 percent of the catch. The remaining 9 percent was taken by haul seines, pound nets, lines, dip nets, reef nets, and wheels.

PACIFIC COAST SARDINE FISHERY

The California sardine season was another dismal failure. The catch dropped from 74 million pounds in 1959 to only 58 million pounds in 1960. It was the fourth smallest catch taken since 1915. There was no lack of fishing effort, and weather did not limit fishing activities. Sardines just failed to appear in appreciable quantities--catches were spotty and light in normal fishing areas. High surface water temperatures were believed, at least partially, responsible for poor showings of sardines during most of the season. Only a few thousand cases of sardines were packed in San Francisco, and most of the fish canned in Monterey was trucked from southern ports. Almost all the 1960 pack, the lowest since 1957, was processed in southern California.

PACIFIC MACKEREL FISHERIES

The 1960 catch of jack mackerel (75 million pounds) was 37 million pounds greater than in 1959. Pacific mackerel (37 million pounds) was taken in about the same amounts as in the previous year. The combined catch (112 million pounds valued at \$2.4 million) represented an increase over 1959 of 36.6 million pounds valued at \$490,000 to the fishermen. Lacking sardines in consistent quantities during the fall months of the year, seiners took substantial quantities of mackerel. Cannery requirements for jack mackerel were stimulated by the poor sardine season. As in previous years, most of the catch of both jack and Pacific mackerel was landed in the San Pedro district. About 79 percent of the jack mackerel and 88 percent of the Pacific mackerel was landed in this district.

Nearly all of the jack mackerel and 87 percent of the Pacific mackerel were taken by purse seines and lampara nets. Otter trawls, gill and trammel nets, lines, and brail or scoop nets accounted for the remainder of the catch.

REVIEW OF CERTAIN MAJOR FISHERIES

PACIFIC TUNA FISHERY

The 1960 domestic catch of tuna landed at Pacific Coast and Hawaiian ports totaled 296.8 million pounds valued at \$37.5 million. Compared with the previous year, this represented an increase of 14 million pounds and \$257,000. In Hawaii, the catch was down due to small landings of skipjack tuna; however, the Pacific Coast fishery had a better year than in 1959. Landings on the mainland increased from 268 million pounds in 1959 to 288 million pounds in 1960. Outstanding in the economic recovery of the fishery was the success of clippers converted to seiners. Tuna seiners demonstrated both efficiency and economy by taking larger catches in less than half the time required by the tuna clippers. In 1959, purse seiners accounted for 27 percent of the Pacific Coast landings. In 1960, they accounted for 59 percent of the total landings in this area.

In 1960, a total of 4,858 fishermen, 1,081 vessels, 241 motor boats, and 213 accessory boats engaged in the United States Pacific tuna fishery.

REVIEW OF CERTAIN MAJOR FISHERIES

463

UNITED STATES MENHADEN FISHERY

The 1960 menhaden catch totaled 2 billion pounds and accounted for 41 percent of the total United States production of all aquatic products. The catch was 184 million pounds less than in 1959, but the third largest in the history of the fishery. Increased catches of menhaden in the Gulf of Mexico resulted in a record catch of 841 million pounds from the waters of Mississippi, Louisiana, and northern Texas. Along the Atlantic Coast, the catch was less than in 1959 because of reduced production off Virginia and North Carolina.

Purse seines accounted for 98 percent of the 1960 catch. Haul seines, otter trawls, pound nets, gill nets, floating traps, fyke nets, and trammel nets accounted for the remainder.

Of the total, 42 percent was landed in the Gulf of Mexico, 33 percent in the Middle Atlantic, 12 percent in the Chesapeake, 11 percent in the South Atlantic, and 2 percent in the New England area.

There is included in this Section a detailed summary of operating units engaged in the Atlantic and Gulf Coast menhaden purse seine fishery. During 1960, a total of 4,353 fishermen, 183 vessels, and 576 accessory craft was engaged in the menhaden fishery.

UNITED STATES CLAM FISHERY

The 1960 yield of the United States clam fishery totaled nearly 50 million pounds of meats valued at \$12 million to the fishermen. Compared with the previous year, this represented an increase of 10 percent in volume and 5 percent in value. The Middle Atlantic led all other areas in the production of clam meats with 64 percent of the total. The New England and Chesapeake States each accounted for 16 percent of the total. The remaining 4 percent was produced in the South Atlantic, Gulf, and Pacific Coast areas.

Dredges accounted for 34.8 million pounds or 70 percent of the total clam meat production. Tongs harvested 5.2 million pounds or 11 percent. The remainder of the catch was taken with rakes, hoes, shovels, forks, or gathered by hand.

In Section 13 of this Digest, under the heading "Conversion Factors", there is a table which gives the average State yield per United States standard bushel for the clams taken on the Atlantic and Gulf Coasts. Supplementary shellfish tables appear after the summary tables for each Atlantic and Gulf regional section.

REVIEW OF CERTAIN MAJOR FISHERIES

469

UNITED STATES CRAB FISHERY

The 1960 catch of crabs in the United States amounted to a record 222 million pounds valued at over \$17 million to the fishermen. Compared with the 1959 catch, this represented an increase of 47 million pounds or 27 percent in volume and \$2.3 million or 15 percent in value.

The Chesapeake States (70.7 million pounds) led all areas in volume accounting for 32 percent of the catch and 27 percent of the value. The Pacific Coast led in value with a landed weight of 65 million pounds valued at \$7.6 million--45 percent of the total value.

Pacific Coast Dungeness crab landings remained at about the same level as in the previous year. Alaska king crab landings increased from 19 million pounds in 1959 to 29 million pounds in 1960. The catch of hard blue crabs (150 million pounds) was 37 million pounds larger than in 1959.

In Section 13 of this Digest, under the heading "Conversion Factors", is a table which gives the average number of crabs per pound by species for each of the Atlantic and Gulf States. Supplementary shellfish tables are shown after the summary tables for each Atlantic and Gulf regional section.

KING CRAB

REVIEW OF CERTAIN MAJOR FISHERIES

UNITED STATES OYSTER FISHERY

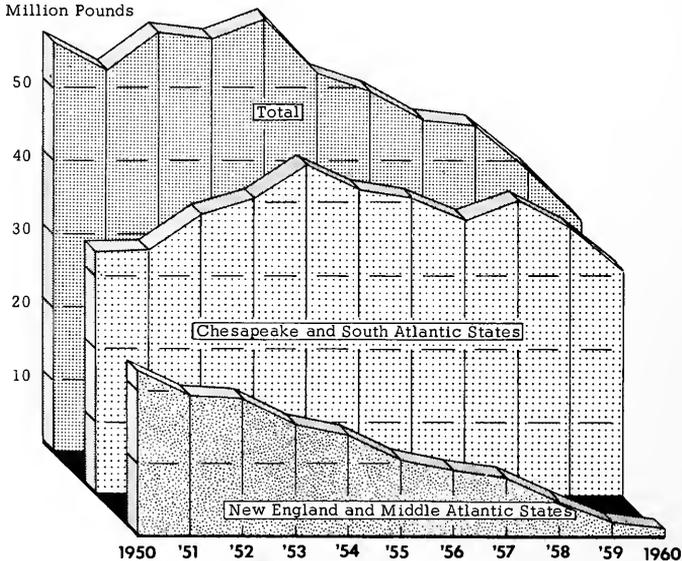

The 1960 United States oyster catch amounted to 60 million pounds of meats valued at \$29.2 million. This was a decrease of 4.7 million pounds or 7 percent in volume and \$241,000 or about 1 percent in value. Increases occurred in the South Atlantic and Gulf catch in 1960, but all other areas were down. The production along the Atlantic Coast fell to an alltime low of only 33 million pounds of meats.

Despite a falling off in production, the Chesapeake Bay area led all other areas, accounting for 27 million pounds or 45 percent of the 1960 catch. The Gulf States were in second place with 16 million pounds or 27 percent. The Pacific area accounted for 18 percent with the remaining 10 percent from the New England, Middle Atlantic, and South Atlantic States.

Dredges accounted for 38 million pounds of meats or 63 percent of the total oyster catch, while tongs (18.8 million pounds) accounted for 31 percent. The remainder of the catch was taken with rakes, grabs, forks, or gathered by hand.

In Section 13 of this Digest is a table which gives the volume of the bushel measures used for oysters in the various Atlantic and Gulf States and the average yield per bushel. Supplementary shellfish tables appear after the summary tables for each Atlantic and Gulf regional section.

TOTAL	60,010	29,242

1/ EASTERN, PRIVATE, INCLUDES 300 POUNDS OF OYSTERS, VALUED AT \$691 HARVESTED IN CALIFORNIA.

REVIEW OF CERTAIN MAJOR FISHERIES

UNITED STATES SHRIMP FISHERY

The 1960 catch of shrimp in the United States totaled 249.5 million pounds valued at \$66.9 million. This was an increase of 9.3 million pounds or 4 percent in volume and \$8.8 million or 15 percent in value. Landings in the South Atlantic area increased by 20 percent and in the Gulf States by 6 percent. On the Pacific Coast, landings were down from 20.7 million pounds in 1959 to 12.4 million pounds.

The otter trawl fleet accounted for 243.8 million pounds or 98 percent of the total catch. An additional 5.4 million pounds were taken by beam trawls. Bag nets, pots and traps, push nets, and cast nets accounted for the remainder.

There is included in this Section a detailed summary of the operating units engaged in the United States shrimp otter trawl fishery. The data include information on the fishermen employed and on the number of vessels operated in each State and region. There is a breakdown by tonnage classification. In 1960, there were 15,496 fishermen employed on 7,708 fishing craft which operated in the United States shrimp otter trawl fishery.

REVIEW OF CERTAIN MAJOR FISHERIES

UNITED STATES FISH OTTER TRAWL FLEET

There are included in this Section summaries of the United States fish otter trawl fleet. They contain detailed information on the operating units engaged in this fishery and a breakdown of vessels by area, State, and gross tonnage. In 1960, 1,318 vessels of over 5 net tons and 145 motor boats were engaged in the fish otter trawl fleet. These fishing craft employed a total of 5,699 fishermen and operated 1,534 otter trawls. In some instances, two trawls were fished by a single vessel.

HISTORICAL FISHERY STATISTICS

Statistics of the fisheries of the United States are necessary for the best use of the Nation's aquatic resources. As series of data for extended periods of time are accumulated, the information becomes increasingly more valuable in indicating trends in the supply and utilization of fishery products. The extent to which these data are used is frequently dependent upon the ready availability of needed information to researchers, management officials, and members of the fishing industry.

Periodically, there are published in "Fishery Statistics of the United States" historical data for each State on the catch of important species. The most recent publication of these data was in Statistical Digest No. 43 entitled "Fishery Statistics of the United States, 1956."

The Bureau of Commercial Fisheries has in its files and in various Bureau reports or publications of other organizations a large volume of historical data. These statistics would be of considerable use to researchers and others interested in the fisheries. Unfortunately, few know of these records. To make the series readily available to researchers and others interested in the fisheries, a section entitled "Historical Fishery Statistics" has been published, since 1951, in "Fishery Statistics of the United States." The titles of the series published, and the identifying number of the Digest in which each appears, follow:

Series	Published in Statistical Digest
Menhaden Fishery, 1873 - 1951	No. 30
Oyster Fishery, 1880 - 1952	No. 34
Pacific Sardine Fishery, 1915 - 1953	No. 36
Atlantic Ocean Perch Fishery, 1930 - 1954	No. 39
Pacific Herring Fishery, 1881 - 1955	No. 41
United States Haddock Fishery, 1880 - 1956	No. 43
United States Tuna Fishery, 1911 - 1957	No. 44
United States Atlantic Cod Fishery, 1893 - 1958	No. 49
Fur Seal Industry of the Pribilof Islands, 1786 - 1959	No. 51

The 10th series of historical data containing information on the Eastern Pacific Halibut Fishery is included in the following pages.

EASTERN PACIFIC HALIBUT FISHERY, 1888 - 1960

By F. Heward Bell, Assistant Director
International Pacific Halibut Commission

The Pacific halibut, *Hippoglossus stenolepis*, is found on the continental shelf in boreal waters from about 3° to 8° C. It is almost indistinguishable from the halibut, *H. hippoglossus*, of the northeastern and northwestern Atlantic and any differences are probably varietal rather than specific.

Its recorded occurrence in the eastern Pacific extends from Santa Rosa Island, California to Norton Sound in the Bering Sea and in the western Pacific from Hokkaido, Japan to the Gulf of Anadyr. The range of commercial abundance in the eastern Pacific extends from northern California to the Pribilof Islands where it is fished commercially in waters from 20 to 250 fathoms.

The halibut is the largest of the flatfish, ranging on the eastern Pacific to a recorded maximum of 495 pounds with the present average landed size being about 30-35 pounds. The females are faster growing and no male over 123 pounds has been observed to date. All weights quoted in this text and accompanying tables refer to eviscerated heads-off landed amounts.

HISTORICAL FISHERY STATISTICS

From late November to early March, spawning concentrations occur at a number of locations in the eastern Pacific chiefly at depths of about 175 to 225 fathoms. The average age of first maturity is about 12 years for the females and probably 8 years for the males. A large female may produce 2 to 3 million eggs.

The fertilized and developing eggs rise to midwater levels and are transported considerable distances by the ocean currents. After about 6 to 7 months, the postlarvae, having risen into the surface inshore drift, commence their demersal or bottom existence close to shore. The 1- to 3-year-old juveniles tend to remain on inshore grounds, then move offshore where they first enter the commercial longline fishery in significant numbers at about 5 to 7 years of age.

The Pacific fishery began in 1888 off Cape Flattery, Washington, and from its inception has been a joint venture of the fleets of Canada and the United States. By the turn of the century, the annual catch had attained about 10 million pounds. The unregulated fishery expanded rapidly, and in 1915 the catch reached 69 million pounds. Thereafter, in spite of increases in fishing effort and extension of the fishery throughout the entire commercial range of the species, the production declined. In 1931, the catch amounted to only 44 million pounds.

Control of the fishery was advocated by the industry as early as 1915 on the basis of the declines in yields from the longer fished grounds. Subsequent declines from newer grounds led to the signing in 1923 and the ratification in 1924 of a convention by the United States and Canada directed at the outset chiefly to an investigation of the condition of the fishery and the proposal of measures for its rehabilitation by a joint commission now known as the International Pacific Halibut Commission.

Regulations that have been enacted each year since 1932 under the subsequent conventions of 1930, 1937 and 1953 have resulted in a trebling in size of the stocks on the grounds since 1932. The Commission has steadily increased the permitted annual catches and such increased annual catches have been taken with progressively less fishing effort.

Landings by United States and Canadian fleets by sections of the coast are shown in thousands of pounds in Table 1. From time to time, various ports have been dominant centers of landing for the halibut fleets. Shifting from one to another has been occasioned by such basic considerations as the location of the grounds being fished, depletion of nearby grounds and their subsequent controlled rebuilding, changes in the size, structure, and motive power of the fishing vessels, the length of the fishing season, wartime conditions, and many other considerations.

The decade since 1951 has seen a sharp increase in landings in Washington State by both United States and Canadian vessels, a lesser increase in British Columbia with the decline in landings there by United States vessels being more than offset by increased landings by Canadian vessels. Receipts in Alaska have shown a moderate increase due to larger landings by Canadian vessels, while there was little change in United States deliveries.

The trends of the catch, expressed in thousands of pounds, from the different fishing grounds off each section of the coast are observable in Table 2. In general they reflect the early geographical expansion and intensification of the fishery, the subsequent declines from each section under uncontrolled fishing, and the increases under regulation after the early 1930's. All grounds are now substantially producing their present sustainable yields, and none is far removed from its maximum sustainable level, which for the coast as a whole is probably in the vicinity of about 75 million pounds annually.

Paralleling the conditions that have developed in the unregulated northeastern Atlantic halibut fishery, the Pacific Coast catch without control would now probably be about 25-30 million pounds

annually. It would consist as in Europe of a high proportion of juvenile fish under 5 pounds caught chiefly by trawl net gear at a relatively low level of return per unit effort. The annual catch in Europe is currently about 25 million pounds. In contrast the permitted catches in the eastern Pacific are now about 72 million pounds annually consisting of individuals chiefly from 6 to 25 years of age and weighing from 5 to over 200 pounds.

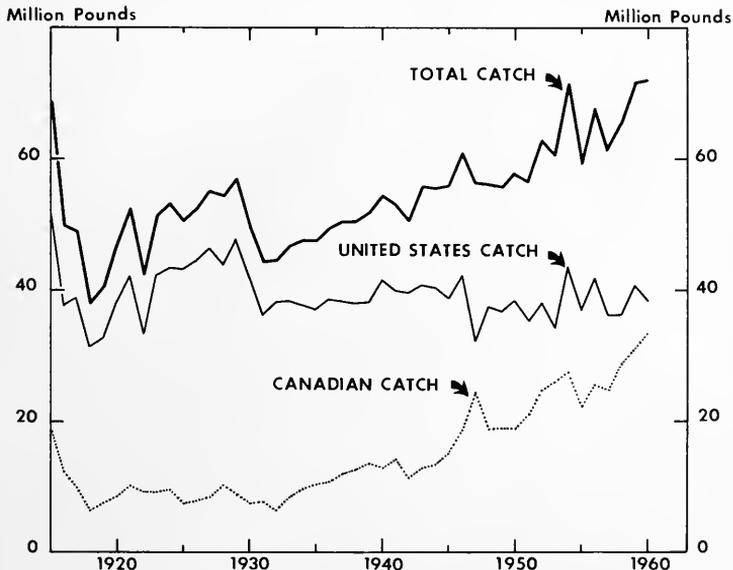

Effective control of the halibut catch in Europe is now probably not practicable due to the preponderance of other and more important demersal species in the trawl catches. In the eastern Pacific fishery, halibut is caught by hook and line gear exclusively, all net gear being prohibited.

Lack of control in the Pacific fishery would probably have entailed a cumulative loss in production of halibut amounting to over 1/2 billion pounds over the 29 years since regulation began and worth at least \$99 million to the fishermen at the various dock prices that have prevailed during the period. At the consumer level, the dollar value of this large gain would be nearly trebled.

In addition, the reduction in fishing effort required to take the large catches each year has permitted the men and vessels to contribute further to the economy by engaging in other productive enterprises during the time saved from halibut fishing.

In attaining these results, the two Governments have jointly appropriated to the Commission less than \$2.5 million during the past 29 years. This modest investment thus has already been returned many times over to the people and to the economies of the two countries. It reaffirms the wisdom and foresight manifested 37 years ago by Canada and the United States when first contracting for the joint scientific management of the Pacific halibut fishery.

^{1/} 1888 to 1950 from Bell, Dunlop and Freeman, I. F. C. Rept. No. 17, 1952.

^{2/} No figures available for California and Oregon landings until 1915, but they are known to have been inconsequential in early years.

^{3/} No suitable figures available until 1911 for an accurate separation of Alaska and Washington landings.

^{4/} Includes 276,000 pounds landed by Canadian vessels in Oregon.

Note.--The quantities shown represent the eviscerated heads-off landed weight of the fish. Conversion to round weight can be made by multiplying these weights by 1.33.

1/ For the years 1920 and earlier, it has been possible to separate the landings with full assurance only as to whether they originated from grounds south or west of Cape Spencer. Since 1921 the catch has been assigned to the following fishing grounds:

- Column A - South of Willapa Harbor
- Column B - Willapa Harbor to Cape Scott
- Column C - Cape Scott to Dixon Entrance
- Column D - Dixon Entrance to Cape Spencer
- Column E - Cape Spencer to Cape St. Elias
- Column F - Cape St. Elias to Trinity Islands
- Column G - Trinity Islands and Westward
- Column B to D - Willapa Harbor to Cape Spencer
- Column E to G - West of Cape Spencer

Note:--The quantities shown represent the eviscerated heads-off landed weight of the fish. Conversion to round weight can be made by multiplying these weights by 1.33.

HALIBUT SCHOONER

STATISTICAL SURVEY PROCEDURE

This report is another in a series of annual statistical reports containing detailed statistics, analytic textual reviews, and graphic presentations on the commercial fisheries of the United States. Included are data on the quantity and value of the commercial yield of fishery products by States, regions, waters, and gear; and the number of persons and operating units engaged in the fisheries. The publication contains data on the volume and value of processed fishery products, freezings and cold-storage holdings, foreign trade, and other related information. The report has been prepared and published by the Bureau of Commercial Fisheries, Fish and Wildlife Service, United States Department of the Interior, and is a continuation of a series inaugurated by its predecessor organizations in the Departments of Interior, Commerce, Commerce and Labor, and the United States Fish Commission.

In order that those who use the statistical data contained in this and previous reports may be informed as to the source of the figures and methods for their collection, it has been deemed advisable to outline, in moderate detail, the survey procedure followed. This procedure has been developed over a period of years, and changes in methods have been made at times when such changes have appeared to work toward general improvement. While the surveys in different sections are not made in the same manner, owing to varying facilities and records, an attempt has been made to make the data collected by various methods comparable with respect to the same year as well as over a period of years. Throughout the entire plan it has been the intention to coordinate state and federal fishery statistical work so that there will be as little duplication of effort as possible.

SECTIONAL SURVEYS

Statistical surveys of the fisheries and fishery industries of the various sections of the United States occupy by far the greatest part of the time of the personnel of the Branch of Statistics. In the course of these surveys, the field representatives visit the individual fishing localities of the various States to collect statistics on the volume and value of the catch of fish and shellfish, employment in the fisheries, quantity of

fishing gear, number and classification of fishing and transporting craft, and the volume and value of manufactured fishery products and by-products. The various phases of these surveys are discussed in detail in the sections following.

History -- The first comprehensive statistical study of the fisheries and fishery industries of the United States was made for the year 1880 by George Brown Goode, Assistant Director of the United States National Museum, and associates, with the cooperation of the Commissioner of Fisheries and the Superintendent of the Tenth Census. Data for specific fisheries, or restricted sections for years prior to 1880, also were collected in the early survey and recorded in Mr. Goode's reports. The survey for 1880, however, did not include the Mississippi River and its tributaries. Periodic general surveys of a limited number of States or limited areas of the United States were made for the years from 1880 to 1907 and from 1909 to 1928. The first complete statistical canvass of the entire United States was made for 1908 by the Bureau of the Census. The next general survey of the entire United States was not made until 1931, although complete data for all sections, excluding the Mississippi River and its tributaries, were collected for 1929 and 1930. Complete data on the catch and operating units for these same sections were also collected for 1932. In the latter survey, however, lack of sufficient funds prohibited collection of data on the wholesale and manufacturing operations except those data collected as a part of the canned fishery products and byproducts survey. Various sections were surveyed during the years from 1933 to 1949, inclusive. A complete survey of all sections of the country was made for 1950. Since 1951, all of the coastal areas were canvassed annually, and catch records were obtained for the Lakes section. Complete operating unit and catch data have been obtained for all areas since 1954. Data on the wholesale and manufacturing industries were collected in all of the surveys from 1933 to 1940, inclusive. In the years from 1941 to 1949, inclusive, and in 1951, lack of experienced personnel and budgetary limitations precluded the collection of data on wholesale and manufacturing firms except for those data collected as part of the canned fishery products, byproducts, and packaged fish surveys.

STATISTICAL SURVEY PROCEDURE

The chart on page 495 indicates the years for which surveys have been made in the various sections. Figures for more recent years are available from the Bureau in bulletin form, but data for the earlier years are available only in the Fish Commission and Bureau of Fisheries printed reports. These reports are available for reference in the Department of the Interior library and in many public libraries.

Since the surveys of the fisheries have varied in completeness three legends have been used for the years shown in the chart to indicate whether complete, partial, or no surveys were conducted in the individual regions. The designation "complete survey" has been used to indicate that basic operating unit and catch data were obtained and that complete information was collected on employment in wholesale and manufacturing establishments and on the production of manufactured fishery products. The legend "partial survey" usually indicates that operating unit and catch statistics were collected, but that no information was obtained on employment in wholesale and manufacturing establishments and that only partial data were obtained on the production of manufactured fishery products. In some instances the designation "partial survey" is used for regions in which only catch statistics were collected. The legend "no survey" indicates that a general canvass was not conducted to obtain operating unit, catch, employment in wholesale and manufacturing plants, and complete manufactured products data. Although the chart indicates that in certain regions no surveys were conducted, some information may be available on the landings at certain important ports. Likewise, information on the catch of certain species, such as menhaden, may be available as a result of data collected in connection with the annual canned fish and byproducts survey. Data on the annual production of canned fishery products and byproducts have been collected for all regions since 1921, while information has been obtained on the production of packaged fish for 1926 and annually since 1928.

A bibliography listing the various surveys made since 1880 and the publications in which the results were published appeared in Statistical Digest No. 43, "Fishery Statistics of the United States, 1956." A list of the statistical bulletins in the Current Fishery Statistics series published

during 1960 may be found in Section 16 of this digest.

Field Personnel--The statistics contained in this volume have been collected by a group of trained fishery marketing specialists of the Bureau.

Period Covered--These specialists are assigned permanent field stations, generally in the principal port within their field, and travel from that station in conducting their various surveys. Most of the agents collect statistics on landings for the current year, and assemble final operating unit, catch, and manufactured products data for the previous year. It is usually three to ten months after the end of the calendar year for which they are collecting data before the final figures for this digest are available. The data are tabulated and prepared for publication before the end of the year. The figures are collected and published on a calendar year basis. Prior to 1930, statistics on the catch of oysters in the Atlantic and Gulf States were collected for the oyster season; that is, from September to April, inclusive. Beginning with 1930 and continuing to the present time, they have been collected on the basis of the calendar year.

Scope--The coastal statistical surveys include canvasses of the commercial fisheries of the oceans, bays, and coastal rivers as far inland as commercial fishing is important. This usually coincides with the range of commercial fishing for anadromous species. Statistics on the fisheries of the Mississippi River include those of the Mississippi River proper as well as all of its tributaries where in commercial fishing for either fish, crustaceans, or mollusks is carried on. Statistics on the fisheries of the Great Lakes cover canvasses of the fisheries in the lakes proper, adjacent bays, the International Lakes of northern Minnesota, and rivers which sustain a commercial fishery having outlets into these waters. Statistics on the fisheries of Florida include the commercial fisheries in Lake Okeechobee and other inland lakes. Surveys for statistics of the wholesale and manufacturing fishery industries cover plants located in the coastal, river, and lake areas adjacent to the waters mentioned above.

Methods of Collection--There are several methods used in the collection of fishery

COMPLETE SURVEY

PARTIAL SURVEY

NO SURVEY

STATISTICAL SURVEY PROCEDURE

statistics, each of which has been carefully studied to obtain the best results with available personnel and funds. In most instances the field personnel obtain from local customs officials lists of fishing vessels and names of owners of these craft. Also it is usually possible to obtain the names of licensed commercial fishermen, fishing craft, and some statistics on the catch, from State fishery agencies; from other State, county, or city sources; or from private organizations.

Using available preliminary records as a guide, the field specialists visit each fishing community in their field unless these preliminary records are so complete that personal visits may be eliminated. If complete catch data are not available from central sources, wholesale dealers and manufacturers of fishery products are visited and data are obtained from them on their purchases of fish and shellfish. It is impossible for the few Bureau representatives available for this work to interview each fisherman in a given locality. However, the more important areas and a sufficient number of areas of lesser importance are visited to obtain reliable information on production, the number of fishing craft engaged, the quantity of gear operated, catch by gear and waters, and the number of persons employed as fishermen.

The Bureau's role with regard to fishery statistics is principally that of coordinating the collection of information, assembling, analyzing, publishing, and disseminating fishery data. The collection of basic operating unit and catch statistics is primarily a State function. The State fishery agencies in a number of States have developed relatively complete statistical systems which greatly facilitate the Bureau's surveys in these States. In such instances, the Bureau conducts only such surveys as may be necessary to make the data comparable with those of other States.

The Bureau obtains from the records of the State fishery agencies most of the catch statistics for the fisheries of the Great Lakes, the northern Mississippi River area, and the International Lakes of northern Minnesota. To obtain data on the number of fishermen, boats, vessels, and gear, the Bureau conducts such personal surveys among the fishermen as may be necessary

to supplement the State records.

Bureau statistical personnel are stationed at Seattle, Washington; Astoria, Oregon; and San Pedro, California for the purpose of surveying the fisheries of Washington, Oregon, and California. They obtain from the records of the State fishery departments figures on the volume of the catch and operating units. The value of the catch is derived from State and dealers' records. In Washington and Oregon, data for operating units in the offshore fisheries are obtained from the records of various fishery organizations as well as from records of the State fishery agencies. Statistics of the wholesale fishery industry for this section are obtained largely by personal interviews.

In many States, the Bureau and the fishery agency of the respective States cooperate in the collection and publication of current monthly and annual data on the catch. These data form the basis of the annual catch figures published in this report for the following States; Maine, Massachusetts, Rhode Island, New York, New Jersey, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, Washington, Oregon, California, Hawaii, and Ohio.

In the administration of the Alaska fisheries, the State requires that copies of all receipts for fish and shellfish purchases from fishermen be furnished to the Alaska Department of Fish and Game. The data on these tickets are compiled and made available to the Bureau. The summary data, by districts, are reproduced in this report.

Statistics on the volume of the catch of fish in the Great Lakes States usually are shown in weights as landed, which may be in the round or drawn condition. Statistics on the volume of the catch of fish taken in the remainder of the United States are usually shown in round weight.

The figures in the tables for shellfish represent the weight of the meats in the cases of univalve and bivalve mollusks, and the round weight of crustaceans and such mollusks as squid and octopus.

Shore and Vessel Fisheries--In general, statistics of the shore fisheries, as collected by the Bureau's representatives, include

data on the number of casual and regular fishermen; number of motor and other fishing boats and accessory boats (craft of less than 5 net tons capacity are called "boats"); type and quantity of gear used; and the volume, value, and method of capture of each species for each locality or group of localities. This method is not followed in some sections where the availability of data collected by the State fishery agencies obviates the necessity of detailed locality surveys.

Statistics of the vessel fisheries include data on the number in the crew; rig of vessels; gross tonnage; kind and quantity of gear used; accessory boats carried; and volume, value, and method of capture of each species. Craft having a capacity of 5 net tons or over are called "vessels". As in the shore fisheries, the availability of figures collected by State fishery agencies may eliminate the necessity of our Bureau agents collecting these data for individual vessels.

Statistics on the quantity of gear operated indicate the maximum number of units fished at any one time during the year. Gear carried in reserve for replacement is not reported.

All persons engaged in commercial fishing operations are included as fishermen. In most areas fishermen not on vessels have been divided into "regular" and "casual". Regular fishermen are defined as those who receive more than one-half their annual income from fishing; whereas casual fishermen are those who receive less than one-half their annual compensation from fishing. On the Pacific Coast, it has not been possible to separate regular from casual fishermen.

Since 1942, the catch of fish and shellfish has been credited to the port at which it was landed. Prior to the survey for that year, it was the practice of the Bureau to credit the entire catch of a vessel to the principal port at which fish or shellfish were unloaded, regardless of the actual point of landing. This policy was discontinued since it quite often resulted in inconsistencies by crediting catches of some species to areas far removed from localities in which they are commonly taken. An outstanding example of this is the southern trawl fishery conducted off the New Jersey, Maryland, Virginia, and North Carolina coasts. Some fishing vessels from New

England operate in this fishery for 6 to 10 weeks during the winter season. Prior to the survey for 1942, the catch of these vessels, consisting principally of fish common to Middle Atlantic waters, was credited to Massachusetts. Under the present system, this catch is credited to the Middle Atlantic ports where it is landed.

Since 1949 on the Pacific Coast and 1951 for the balance of the country, craft, fishermen, and gear have been reported for each State in which they fished. A total exclusive of duplication is shown for each section, and for the United States as a whole. Prior to the surveys for 1949, each craft on the Pacific Coast was credited to its home port unless it did not fish from that port during the year. In that case, it was credited to the locality where it landed the greatest portion of its catch. Prior to the survey for 1951, each craft on the Atlantic and Gulf Coasts and interior waters was credited to the port where it landed the greatest portion of its catch during the year. This system was changed to provide more accurate data on the total number of craft operating in a given State. With the increased mobility of the fishing fleet in recent years, the number of vessels fishing in more than one State has increased greatly.

Beginning with data for 1951, the reporting of units of gear was standardized so that nets or lines made up of small units for ease in handling, but fastened together in fishing, were counted as a single unit rather than as a number of smaller units. Prior to 1951, the small units were sometimes counted as individual pieces of gear even though they were combined for fishing. This rule does not apply to halibut longlines or setlines on the Pacific Coast. In this fishery each skate of gear is counted as one line, even though they are fastened together in fishing, because the International Pacific Halibut Commission uses a skate of gear as a unit in its studies of fishing intensity.

Publication of Data--Statistics on employment in the fisheries, craft and gear engaged, quantity and value of catch, and certain data on industries related to the fisheries are summarized according to geographic divisions and published in bulletin form as soon as possible after the completion of each survey. Later, the figures, in more detail, are included in the

STATISTICAL SURVEY PROCEDURE

annual statistical report of the Bureau entitled "Fishery Statistics of the United States."

Data on the operating units (fishermen, fishing craft, and gear) and catch by counties for the Atlantic and Gulf States have been included in these annual statistical reports for the years from 1928 to 1938 except for 1932. These data have also been published in the digests for the years 1945, 1950, 1955, and 1960. County data were collected for the State in which surveys were conducted during the years since 1938, except for Maryland. Between 1942 and 1959, only operating unit data by counties have been obtained for Maryland. Complete data were obtained for 1960. County data assembled for the years since 1938, which were not published in the Digest, are on file in the Washington office of the Bureau.

LOCAL AND SPECIAL SURVEYS

Landings at Certain Massachusetts Ports--Detailed statistics are collected on the landings of aquatic products by individual fishing craft at Boston, Gloucester, New Bedford, Plymouth, Provincetown, and other Cape Cod ports. Bureau representatives are stationed at the principal ports. They obtain figures on the quantity and value of fish landed daily by fishing craft, the dates of departure and arrival of the craft, the gear used in their capture, the grounds from which the fish were taken, and other related information. The Bureau's Division of Biological Research and the Branch of Market News cooperate in the collection of these data.

Statistics on landings at the above ports are released monthly and annually in bulletin form, and detailed data are published in the annual statistical digest. Products of American fisheries received duty free at Boston and Gloucester from the treaty coasts of Newfoundland, Magdalen Islands, and Labrador, have not been included in the landings at these ports since 1938. Data on the landings at Boston and Gloucester have been collected annually since 1893. Information on landings at New Bedford has been collected annually since 1938 and at Plymouth, Provincetown, and other Cape Cod ports since 1945.

Shad and Alewife Fisheries--Owing to the importance of the Hudson and Potomac

Rivers in the production of shad, surveys for statistics of the catch, value of the catch, and operating units are made annually. On the Potomac River similar statistics are also obtained for the alewife fishery. Much of the data required for these surveys is available from the State fishery agencies.

Annual data on the shad and alewife fisheries are not published separately in bulletin form. However, a summary is published in the annual statistical digest.

Statistics on the Hudson River shad fishery are available for 1896, 1897, 1898, 1901, 1904, 1910, and annually since 1915, while data for the Potomac River shad fishery are available for 1896, 1901, 1904, 1909, 1915, from 1919 to 1942, inclusive, and annually since 1944. Statistics of the Potomac River alewife fishery are available for 1896, 1909, 1915, from 1919 to 1942, inclusive, and annually since 1944.

Pacific Halibut Fishery--Statistics on the Pacific halibut fishery are obtained primarily from the International Pacific Halibut Commission. Beginning with data for 1956 the fleet classification of halibut craft was revised and vessels were credited in operating unit tables to each district in which they landed fish; the only exception being that United States vessels landing at Prince Rupert, British Columbia, are credited to Southeastern Alaska. Duplication of halibut craft which operated in more than one district has been eliminated in regional and national totals. The catch by the halibut fleet is credited to the port of landing except that fish landed by United States halibut craft in British Columbia is credited to Southeastern Alaska. Halibut statistics are also included in the monthly and annual summaries published by the Seattle Market News Office. Statistics on the landings of halibut at Pacific Coast ports have been collected since 1925.

South Atlantic and Gulf of Mexico Shrimp Fishery--Detailed statistics on the quantity and value of shrimp, by variety and size, landed at South Atlantic and Gulf ports, have been collected for the Gulf area since 1956 and the South Atlantic since 1957. Since 1956, Bureau agents have also obtained daily information on the number of fishing trips, area and

depth fished, and time spent in fishing by craft landing at United States ports in the Gulf of Mexico. The Branch of Market News, the Bureau's Branch of Marine Fisheries of the Division of Biological Research, and various fishery agencies of the southern States cooperate in the collection of these data.

Detailed monthly and annual summaries of the statistics on shrimp landings are published in bulletin form and are summarized in the annual statistical digests.

Hawaiian Fisheries--The volume and value, by species, of the catch landed monthly in the State of Hawaii are furnished the Bureau by the Department of Land and Natural Resources, Division of Fish and Game, Honolulu, Hawaii. Although these data have been published in the Hawaiian section of the Digest since 1946, it was not until 1959 that operating unit, catch, and manufactured products data were assembled in the same manner as those for other States. This allowed them to be included in the national summary tables. The common and scientific names of the species of fish and shellfish landed in Hawaii are not included in Section 14 of this report.

Historical Fishery Statistics--The Bureau of Commercial Fisheries has in its files and in various Bureau reports or publications of other organizations a large volume of historical data on fisheries. Beginning with the 1951 Digest, a section entitled "Historical Fishery Statistics" which includes complete historical information on selected species, has been carried. There is published each year a listing of the titles of the series of data appearing in earlier editions.

Menhaden Purse Seine, Shrimp and Fish Otter Trawl, and Salmon Troll Fleets--Beginning with 1957, detailed data have been published in Section 12 of these digests on the menhaden purse seine and otter trawl fleets. Similar data for the salmon troll fishery are included in this report. The summary operating unit data include information for craft in these fisheries by area, State, and gross tonnage. Prior to 1957, these data were not available since it was impossible to determine from regular operating unit tables the duplication between areas in fishermen and craft.

Canned Fishery Products and By-products--Beginning in 1921, the Bureau has made annual surveys for statistics of the canned fishery products and byproducts industries of every section. These are started the first week in January of each year for statistics on the production in the preceding year. So far as possible, the Bureau obtains by mail, for each domestic canned fishery products and byproducts plant, figures on its annual production. Where it is impossible to obtain the information by mail, the report is secured by a Bureau agent. Included in the data obtained are statistics on the yield and value of the canned products by type of commodity, can size, and area of production. Data on byproducts are obtained by commodity and area of production. The value shown for canned products and byproducts is in the gross amount received by the packer at the production point. No deductions are made for commissions or expenses.

Annual statistical bulletins are issued on this trade, and detailed statistics are published in the annual statistical digest. Prior to 1921, canned fish and byproducts data were not collected for the entire country. However, data on the production of these products were usually obtained for the areas in which general canvass surveys were conducted.

Fish Meal and Oil--Data are collected monthly on the domestic production of fish meal, body oil, fish solubles, and homogenized condensed fish. This information is released monthly and annually in the Bureau's Current Fishery Statistics series of bulletins.

Packaged Fish Trade--Statistics on the annual production and value of fish packaged in the United States, exclusive of the states of Alaska and Hawaii, are obtained in conjunction with the canned fishery products and byproducts survey. These data are released annually in bulletin form and in the annual statistical digest. Statistics on the production of packaged fish are available for 1926 and annually since 1928, except that no data were collected in California for the years 1941 to 1946, inclusive.

Fish Sticks and Portions--Quarterly information is collected and published on

the production and value of cooked and raw fish sticks and breaded, cooked, and raw fish portions, and unbreaded fish portions. The data are released in the Bureau's Current Fishery Statistics series of bulletins.

Cold-Storage Holdings of Fish-- Information on the monthly freezings and holdings of fishery products is obtained from cold storage warehouses by mail and by Bureau employees. Data are also obtained on the holdings of certain cured fish. Bulletins showing these statistics are issued monthly and annually.

Detailed cold-storage statistics also are published in the Bureau's annual statistical digest. Information regarding cold-storage holdings of fishery products has been published since 1917, while data on the quantity of fish frozen have been released for the years from 1920 to 1925, inclusive, and annually since 1928.

Foreign Fishery Trade-- Statistics on foreign fishery trade are obtained from compilations made by the Bureau of the Census, Department of Commerce. Statistics on all known imported or exported fishery products have been assembled and published annually since 1926 in the Bureau's statistical digest. For earlier years, figures are available in the reports of the Bureau of the Census, Bureau of Foreign and Domestic Commerce, the Bureau of Statistics, the Department of Commerce and Labor, or the Treasury Department.

PRACTICES AND TERMS

Certain practices and terms used in this report are explained below.

Operating Units-- Operating units as referred to in this report include persons employed in the fisheries, and craft and gear engaged in the fisheries.

Vessel-- The term "vessel" refers to a craft having a capacity of 5 net tons or over.

Boat-- The term "boat" refers to a craft having a capacity of less than 5 net tons.

Days Absent-- In computing "days absent" for vessels landing fares at certain Mas-

sachusetts ports, the day of arrival, but not the day of departure is included; thus, a vessel leaving port on the 8th of the month and returning on the 15th of the month will be credited with 7 days absence. Prior to 1944, "days absent" included both the day of departure and the day of arrival.

Days Fished-- In computing "days fished" for fishing craft landing shrimp at Gulf of Mexico ports, the total number of hours spent in fishing effort has been divided by 24.

Fish-- The term "fish" as used in this report includes all species belonging to the class Pisces.

Shellfish, etc.-- A shellfish is an aquatic invertebrate animal having a shell, such as a mollusk or crustacean. However, in order to reduce the classifications appearing in the catch tables, all items not properly listed as "Fish" or "Whale Products" have been included under "Shellfish, etc." Accordingly, there is included under this classification turtles, frogs, sponges, seaweed, and worms.

Whale Products-- Since data are not available on the poundage of whales taken, statistics appearing in catch tables on the yield of these mammals represent the weight of products produced such as meal, sperm oil, whale oil, etc. The values shown represent the amount received by the manufacturer for the products.

Incidental Catch-- The term "incidental catch" refers to the catch of certain species by a type of gear which ordinarily does not capture such species.

Percentages-- Percentages are usually shown as whole numbers. Fractions of percents are dropped if less than five-tenths, and the percentage is raised to the next higher integer if the fraction is greater than five-tenths. If the fraction is exactly five-tenths, odd integers are raised to the next even figure while even integers remain unchanged.

Converting-- Many of the figures shown in the summary tables published herewith have been converted to thousands of pounds or thousands of dollars. In making these conversions the sum of the items in a table is raised or low-

ered to the nearest thousand in accordance with standard statistical procedures. The individual items are adjusted to conform to the total thus obtained.

Confidential Data-- The statistical data collected by the Bureau are confidential, and, unless specific authorization is given, are not released in a manner that would divulge private enterprise.

CONVERSION FACTORS

It is the policy of the Bureau to show detailed catch figures of all products in pounds for the sake of uniformity and for purposes of comparison. This represents little difficulty in the case of fish, since in very rare instances are fish reported in units of measure other than pounds. For shellfish, however, the units of measure may be bushels, sacks, barrels, numbers, gallons of meats, etc. These many units make standardization difficult, and when combined with the wide variation in the requirements or definitions of some of these units in the various states, the problem becomes even more complex.

All univalve and bivalve mollusks (except fresh-water mussel shells) are reported in pounds

of meats in the detailed catch tables presented in this report. In addition, there are included supplementary tables for most of the sections, which give data on the production in bushels. These supplementary tables also give the production in number of certain other shellfish, such as crabs. There also is included in the General Review section of this report a table containing data on the shell weight of univalve and bivalve mollusks taken.

Oysters--Probably the greatest problem in the presentation of fishery statistics in uniform units of measure is in the case of oysters. Usually the production of oysters on the Atlantic and Gulf Coasts is reported to Bureau personnel in bushels. Prior to the data obtained for the year 1930, bushels were converted to pounds of meats on the basis of a uniform yield of 7 pounds of meats to the bushel. However, it was found that there was considerable variation in the yield of oysters per bushel particularly in southern states where the yield has ranged as low as half the conversion factor used prior to 1930. There follows a table which gives the measures used for oysters in the various States and the average yields per bushel. The statistical tables in this report are based on these average yields.

SECTION 14 - GLOSSARY

In order to prevent misunderstanding in the use of common names employed in the tables and discussions, the following list of common and scientific names is given for fish, shellfish, and other aquatic products taken by United States fishermen.

Common names as shown in Bureau reports	Other common names	Scientific names
FISH		
Alewives	<div style="display: flex; align-items: center;"> { Branch herring, big-eyed herring, river herring } </div>	<i>Alasa pseudoharengus</i>
Amberjack		<div style="display: flex; align-items: center;"> { Blueback, glut herring, shad herring } </div>
Anchovies	<div style="display: flex; align-items: center;"> { Jack } </div>	<i>Seriola</i> species <i>Engraulis mordax</i> (Pacific)
Angelfish	<div style="display: flex; align-items: center;"> { } </div>	<i>Pomacanthus</i> species <i>Angelicthys</i> species
Anglerfish	<div style="display: flex; align-items: center;"> { Goosefish, allmouth, headfish, monkfish, bellyfish } </div>	<i>Lophius americanus</i>
Ballyhoo	<div style="display: flex; align-items: center;"> { Balao } </div>	<i>Hemiramphus brasiliensis</i>
Barracuda	<div style="display: flex; align-items: center;"> { } </div>	<i>Sphyræna</i> species
Bluefish	<div style="display: flex; align-items: center;"> { Tailor, skipjack } </div>	<i>Pomatomus saltatrix</i>
Blue pike	<div style="display: flex; align-items: center;"> { Pike perch, hard pike, blue pickerel (Canada) } </div>	<i>Stizostedion vitreum glaucum</i>
Blue runner	<div style="display: flex; align-items: center;"> { Runner, hardtail, crevalle } </div>	<i>Caranx crysos</i>
Bonito	<div style="display: flex; align-items: center;"> { } </div>	<i>Sarda sarda</i> (Atlantic) <i>Sarda chiliensis</i> (Pacific)
Bowfin	<div style="display: flex; align-items: center;"> { Fresh-water dogfish, grindle } </div>	<i>Amia calva</i>
Brown trout	<div style="display: flex; align-items: center;"> { } </div>	<i>Salmo trutta</i>
Buffalofish	<div style="display: flex; align-items: center;"> { Winter carp } </div>	<i>Utiobus</i> species
Burbot	<div style="display: flex; align-items: center;"> { Lawyer, ling } </div>	<i>Lota lota</i>
Butterfish	<div style="display: flex; align-items: center;"> { } </div>	<i>Poronotus triacanthus</i>
Cabezone	<div style="display: flex; align-items: center;"> { Marbled sculpin } </div>	<i>Scorpaenichthys marmoratus</i>
Cabio	<div style="display: flex; align-items: center;"> { Black bonito, cobia, ling, lemonfish } </div>	<i>Rachycentron canadus</i>
Cabrilla	<div style="display: flex; align-items: center;"> { Rock bass } </div>	<i>Epinephelus analogus</i> (Pacific)
Carp	<div style="display: flex; align-items: center;"> { German carp, summer carp } </div>	<i>Cyprinus carpio</i>
Catfish and bullheads ..	<div style="display: flex; align-items: center;"> { } </div>	<i>Ictalurus</i> species <i>Pylodictis olivaris</i>
Chubs	<div style="display: flex; align-items: center;"> { Longjaw, bluefin, blackfin (United States), tullibee (Canada) } </div>	All <i>Leucichthys</i> except <i>artedi</i> (Great Lakes)
Cigarfish	<div style="display: flex; align-items: center;"> { Scad } </div>	<i>Decapterus punctatus</i>
Cisco	<div style="display: flex; align-items: center;"> { Herring (Canada) } </div>	<i>Leucichthys artedi</i> (Lake Erie only)
Cod	<div style="display: flex; align-items: center;"> { Codfish } </div>	<i>Gadus morhua</i> (Atlantic) <i>Gadus macrocephalus</i> (Pacific)
Crappie	<div style="display: flex; align-items: center;"> { White crappie, calico bass } </div>	<i>Pomoxis annularis</i>
Crevalle	<div style="display: flex; align-items: center;"> { Black crappie } </div>	<i>Pomoxis nigromaculatus</i>
Croaker	<div style="display: flex; align-items: center;"> { Common jack, jackfish } </div>	<i>Caranx hippos</i>
Cunner	<div style="display: flex; align-items: center;"> { Crocus, hardhead } </div>	<i>Micropogon undulatus</i>
Cutlassfish	<div style="display: flex; align-items: center;"> { Chogset, blue perch, bergall } </div>	<i>Tautoglabrus adspersus</i>
Cusk	<div style="display: flex; align-items: center;"> { Silver eel } </div>	<i>Trichiurus lepturus</i>
Dolly Varden trout	<div style="display: flex; align-items: center;"> { } </div>	<i>Brosme brosme</i>
Dolphin	<div style="display: flex; align-items: center;"> { Salmon trout, bull trout } </div>	<i>Salvelinus malma</i>
Drum:	<div style="display: flex; align-items: center;"> { } </div>	<i>Corphoæna hippurus</i>
Black	<div style="display: flex; align-items: center;"> { Oyster cracker, oyster drum, sea drum } </div>	<i>Pogonias cromis</i>
Red	<div style="display: flex; align-items: center;"> { Channel bass, redfish, spotted bass } </div>	<i>Sciaenops ocellata</i>

Bloodworms.....	Glyceridae
Sandworms.....	<i>Nereis</i> species

SECTION 15 - PICTORIAL SECTION

As many of the readers of this publication may not be familiar with all of the species of fish and shellfish, etc., taken commercially in the United States, illustrations of many of the various species are included in the following pages. The descriptive material appearing with each species includes the areas in which commercial landings are made in the United States and does not constitute the extreme limits in which they occur. Similarly, the gear listed for each species do not represent the only types of apparatus by which these species are obtained, but represent those types which are normally used in their capture. The gear do not necessarily appear in the order of their importance. Illustrations of species landed in Hawaii are not included in this section.

For more detailed information on the nomenclature of the fishery products listed below, the reader is referred to Section 14 of this publication entitled, "Glossary."

ALEWIFE
 RANGE - FLORIDA TO NEW ENGLAND
 GEAR - POUND NETS, GILL NETS, WEIRS,
 DIP NETS, HAUL SEINES, FLOATING TRAPS,
 FYKE NETS

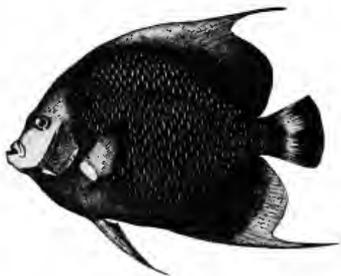

ANGLERFISH
 RANGE - NEW JERSEY TO MASSACHUSETTS
 GEAR - OTTER TRAWLS, POUND NETS

AMBERJACK
 RANGE - FLORIDA
 GEAR - HANOLINES, TROLL LINES

ANCHOVY
 RANGE - CALIFORNIA TO WASHINGTON
 GEAR - PURSE SEINES AND HAUL SEINES

ANGELFISH
 RANGE - FLORIDA
 GEAR - HAUL SEINES

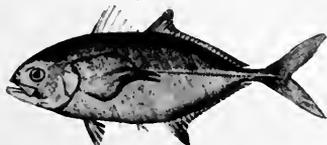

BARRACUDA (ATLANTIC)
 RANGE - FLORIDA
 GEAR - TROLL LINES, HANOLINES

BARRACUDA (PACIFIC)
 RANGE - CALIFORNIA
 GEAR - PURSE SEINES, LONG LINES, HANOLINES,
 TROLL LINES, GILL AND TRammel NETS

BLUEFISH
 RANGE - GULF OF MEXICO TO NEW ENGLAND
 GEAR - HAUL SEINES, GILL NETS, POUND NETS,
 TROLL LINES, PURSE SEINES

BLUE RUNNER OR HARDTAIL
 RANGE - GULF OF MEXICO
 GEAR - HAUL SEINES, GILL NETS, POTS

BONITO (ATLANTIC)
 RANGE - NORTH CAROLINA TO MASSACHUSETTS
 GEAR - POUND NETS, TROLL LINES, GILL NETS

BOWFIN
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, TRAP NETS, FYKE NETS

BUFFALO FISH
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, FYKE NETS, TRAMMEL
 NETS, TROT LINES

BURBOT
 RANGE - GREAT LAKES
 GEAR - GILL NETS, FYKE NETS, POUND
 NETS, TRAP NETS

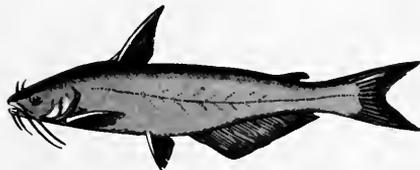

BUTTERFISH
 RANGE - FLORIDA TO NEW ENGLAND
 GEAR - POUND NETS, HAUL SEINES, OTTER TRAWLS

CABIO
 RANGE - FLORIDA TO VIRGINIA
 GEAR - HANDLINES, POUND NETS

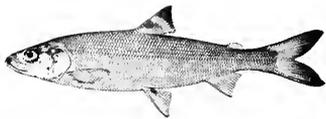

CARP
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, GILL NETS, TRAP NETS,
 FYKE NETS, POUND NETS, TROT LINES

CAT FISH
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, TROT LINES, POUND
 NETS, POTS, FYKE NETS

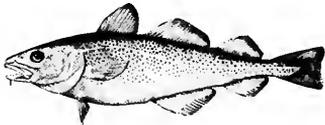

PICTORIAL SECTION

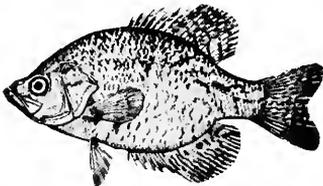

CHUB
RANGE - GREAT LAKES
GEAR - GILL NETS

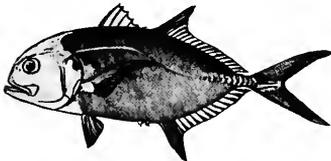

CIGAR FISH
RANGE - FLORIDA
GEAR - HAUL SEINES

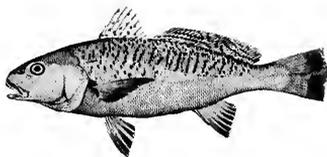

COD
RANGE - VIRGINIA TO MAINE, WASHINGTON,
AND ALASKA
GEAR - OTTER TRAWLS, LONGLINES, GILL NETS

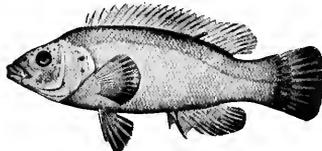

CRAPPIE
RANGE - FRESH-WATER LAKES
GEAR - HAUL SEINES, LINES, POTS

CREVALLE
RANGE - SOUTH ATLANTIC AND GULF STATES
GEAR - HAUL SEINES, GILL NETS, LINES

CROAKER
RANGE - GULF OF MEXICO TO NEW YORK
GEAR - POUND NETS, OTTER TRAWLS, HAUL SEINES,
GILL NETS

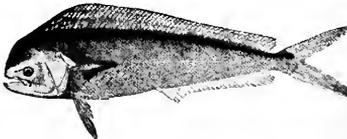

CUNNER
RANGE - NEW ENGLAND
GEAR - OTTER TRAWLS, HANDLINES

CUSK
RANGE - NEW ENGLAND
GEAR - OTTER TRAWLS, LONGLINES

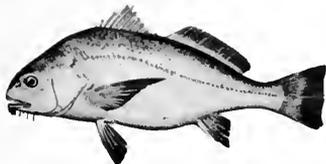

DOLLY VARDEN TROUT
RANGE - PACIFIC
GEAR - POUND NETS, GILL NETS, LINES

DOLPHIN
RANGE - FLORIDA TO NORTH CAROLINA
GEAR - TROLL LINES

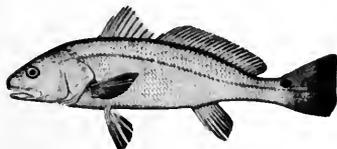

PICTORIAL SECTION

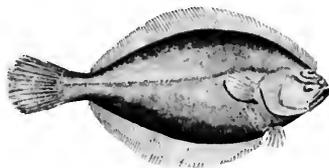

DRUM, BLACK
RANGE - TEXAS TO NORTH CAROLINA
GEAR - HAUL SEINES, POUND NETS, LINES

LEMON SOLE
RANGE - NEW YORK TO MAINE
GEAR - OTTER TRAWLS

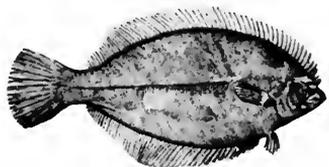

DRUM, RED
RANGE - TEXAS - MARYLAND
GEAR - POUND NETS, HAUL SEINES, GILL NETS,
LINES

DAB
RANGE - MASSACHUSETTS TO NOVA SCOTIA
GEAR - OTTER TRAWLS, LONGLINES

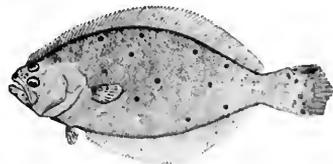

EEL, COMMON
RANGE - FLORIDA TO NEW ENGLAND AND IN
MISSISSIPPI RIVER, LAKE ONTARIO
GEAR - POTS, SPEARS, POUND NETS

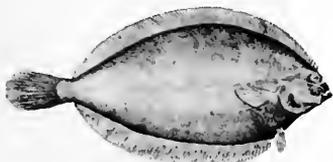

BLACKBACK OR WINTER FLOUNDER
RANGE - NORTH CAROLINA TO MAINE
GEAR - OTTER TRAWLS, POUND NETS, FYKE NETS,
SPEARS, LINES

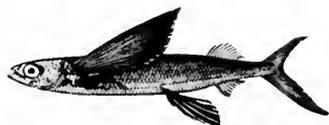

EEL, CONGER
RANGE - FLORIDA TO NEW ENGLAND
GEAR - OTTER TRAWLS

FLUKE
RANGE - TEXAS TO MASSACHUSETTS
GEAR - OTTER TRAWL, SPEARS, LINES

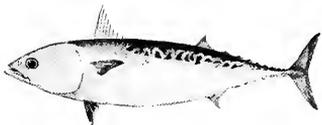

GRAY SOLE
RANGE - MASSACHUSETTS TO MAINE
GEAR - OTTER TRAWLS

FLYING FISH
RANGE - PACIFIC AND ATLANTIC OCEANS
GEAR - GILL NETS

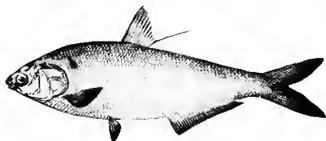

PICTORIAL SECTION

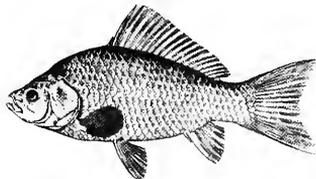

FRIGATE MACKEREL
RANGE - MIDDLE ATLANTIC
GEAR - POUND NETS

GARFISH
RANGE - FRESH-WATER
GEAR - HAUL SEINES, LINES

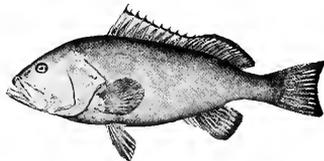

GIZZARD SHAD
RANGE - NORTH CAROLINA TO MARYLAND,
GREAT LAKES
GEAR - HAUL SEINES, POUND NETS, GILL NETS

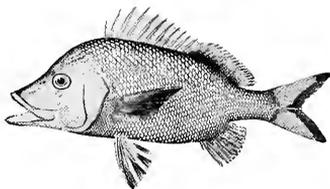

GOLDFISH
RANGE - LAKES AND RIVERS
GEAR - HAUL SEINES, TRAP NETS, FYKE NETS

GRAYFISH
RANGE - PACIFIC
GEAR - LONGLINES, OTTER TRAWLS, GILL NETS

GROUPEE
RANGE - TEXAS TO SOUTH CAROLINA
GEAR - HANDLINES, POTS

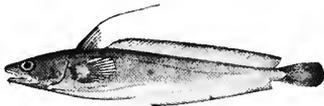

GRUNT
RANGE - FLORIDA
GEAR - POTS, GILL NETS, LINES

HADDOCK
RANGE - NEW ENGLAND STATES
GEAR - OTTER TRAWLS, GILL NETS, LONGLINES

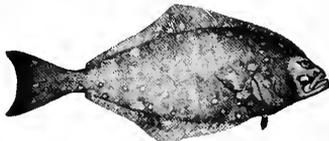

HAKE, RED
RANGE - CHESAPEAKE BAY TO NEW ENGLAND
GEAR - GILL NETS, OTTER TRAWLS, LONGLINES

HAKE, WHITE
RANGE - CHESAPEAKE BAY TO NEW ENGLAND
GEAR - GILL NETS, OTTER TRAWLS, LONGLINES

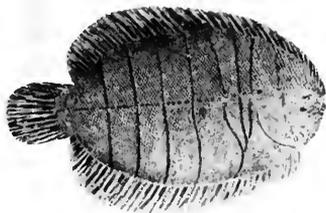

HAKE (PACIFIC)
RANGE - PACIFIC
GEAR - OTTER TRAWLS

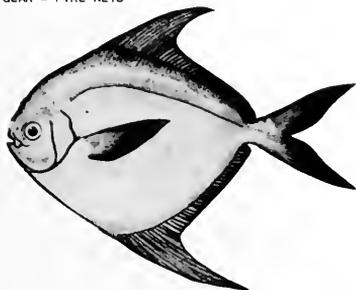

HALIBUT
RANGE - PACIFIC COAST - NEW ENGLAND
GEAR - LONGLINES, OTTER TRAWLS

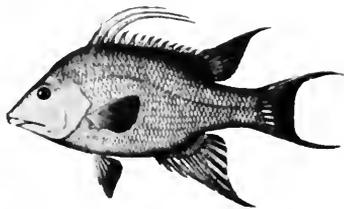

HARDHEAD
 RANGE - CALIFORNIA
 GEAR - FYKE NETS

HOGCHOKER
 RANGE - CHESAPEAKE BAY
 GEAR - POUND NETS, HAUL SEINES

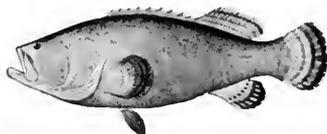

HARVESTFISH OR "STARFISH"
 RANGE - NORTH CAROLINA TO CHESAPEAKE BAY
 GEAR - HAUL SEINES, POUND NETS

HOGFISH
 RANGE - FLORIDA
 GEAR - LINES

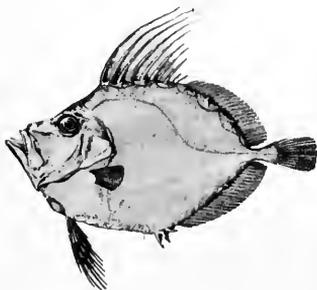

HERRING, LAKE
 RANGE - GREAT LAKES
 GEAR - GILL NETS, HAUL SEINES, POUND NETS,
 TRAP NETS

JEWFISH
 RANGE - FLORIDA
 GEAR - HANDLINES

HERRING, SEA
 RANGE - NEW JERSEY TO NEW ENGLAND, PACIFIC
 COAST STATES AND ALASKA
 GEAR - PURSE SEINES, WEIRS, FLOATING TRAPS,
 STOP SEINES

JOHN DORY
 RANGE - MIDDLE ATLANTIC STATES
 GEAR - OTTER TRAWLS

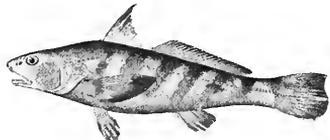

HICKORY SHAD
 RANGE - FLORIDA TO RHODE ISLAND
 GEAR - POUND NETS, HAUL SEINES, GILL NETS,
 FLOATING TRAPS

PICTORIAL SECTION

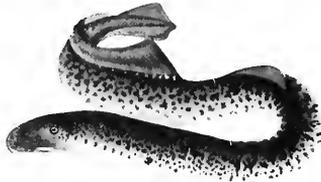

KING MACKEREL
 RANGE - TEXAS TO NEW YORK
 GEAR - TROLL LINES, GILL NETS, HANDLINES

KING WHITING
 RANGE - TEXAS TO MASSACHUSETTS
 GEAR - OTTER TRAWLS, HAUL SEINES, POUND NETS

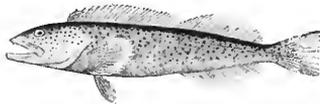

LAKE TROUT
 RANGE - GREAT LAKES
 GEAR - GILL NETS, LINES, POUND NETS (TRAP NETS)

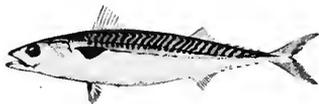

LAMPREY
 RANGE - FRESH-WATER
 GEAR - POTS, FYKE NETS

LAUNCE
 RANGE - NEW ENGLAND
 GEAR - HAUL SEINES

LINGCOD
 RANGE - CALIFORNIA TO ALASKA
 GEAR - OTTER TRAWLS, LONGLINES, HANDLINES

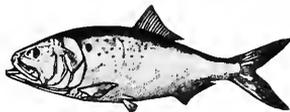

MACKEREL, ATLANTIC
 RANGE - CHESAPEAKE BAY TO MAINE
 GEAR - PURSE SEINES, GILL NETS, POUND NETS,
 FLOATING TRAPS

MACKEREL, JACK
 RANGE - CALIFORNIA
 GEAR - LINES, SEINES, LAMPARA NETS

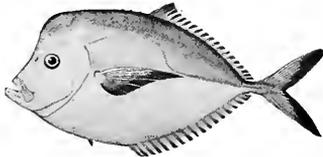

MACKEREL, PACIFIC
 RANGE - CALIFORNIA
 GEAR - LINES, SEINES, LAMPARA NETS

MENHADEN
 RANGE - GULF OF MEXICO TO NEW ENGLAND
 GEAR - PURSE SEINES, POUND NETS

MOONEYE
 RANGE - GREAT LAKES
 GEAR - HAUL SEINES

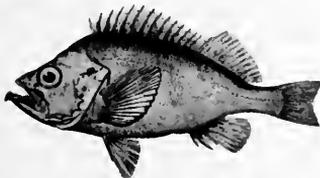

MOONFISH
 RANGE - FLORIDA
 GEAR - HANDLINES, HAUL SEINES

MULLET
 RANGE - TEXAS TO NEW JERSEY
 GEAR - GILL NETS, HAUL SEINES, POUND NETS,
 CAST NETS

OCEAN POUT
 RANGE - NEW ENGLAND
 GEAR - OTTER TRAWLS

OCEAN PERCH
 RANGE - NEW ENGLAND
 GEAR - OTTER TRAWLS

PADDFISH
 RANGE - GULF OF MEXICO, MISSISSIPPI RIVER
 GEAR - HAUL SEINES, TROT LINES

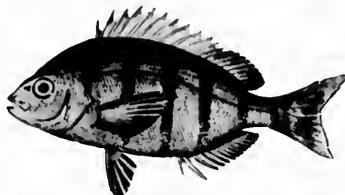

PIGFISH
 RANGE - FLORIDA
 GEAR - PDTs, HANDLINES, GILL NETS

PIKE OR PICKEREL
 RANGE - FRESH-WATER
 GEAR - TRAP NETS, FYKE NETS, GILL NETS,
 POUND NETS, HANDLINES

SARDINE, PACIFIC (PILCHARD)
 RANGE - CALIFORNIA TO WASHINGTON
 GEAR - PURSE SEINES, LAMPARA AND RING NETS,
 GILL NETS

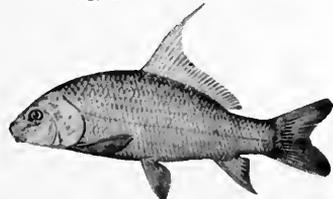

PINFISH
 RANGE - FLORIDA TO NORTH CAROLINA
 GEAR - HAUL SEINES, GILL NETS

POLLOCK
 RANGE - MIDDLE ATLANTIC AND NEW ENGLAND STATES
 GEAR - LONGLINES, FLOATING TRAPS, POUND NETS,
 OTTER TRAWLS, GILL NETS

POMPANO
 RANGE - TEXAS TO NORTH CAROLINA
 GEAR - TRAMMEL NETS, HAUL SEINES, GILL NETS,
 HANDLINES

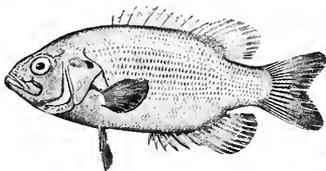

QUILLBACK
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, TROT LINES, FYKE NETS

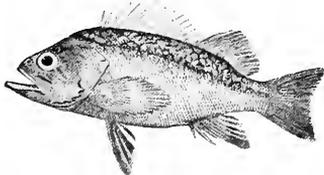

PICTORIAL SECTION

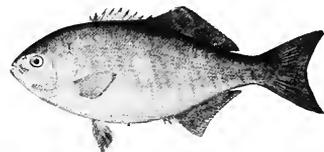

RATFISH
 RANGE - WASHINGTON TO ALASKA
 GEAR - BEAM TRAWLS, LONGLINES

ROCK BASS
 RANGE - GREAT LAKES
 GEAR - TRAP NETS, FYKE NETS, HAUL SEINES,
 GILL NETS

ROCKFISH
 RANGE - CALIFORNIA TO ALASKA
 GEAR - LINES, OTTER TRAWLS, PARANZELLA NETS,
 GILL NETS

RUDDERFISH
 RANGE - CALIFORNIA
 GEAR - LAMPARA AND RING NETS

SABLEFISH
 RANGE - PACIFIC COAST STATES AND ALASKA
 GEAR - LONGLINES, OTTER TRAWLS

SALMON, CHINOOK OR KING
 RANGE - CALIFORNIA TO ALASKA
 GEAR - POUND NETS, PURSE SEINES, GILL NETS,
 HAUL SEINES, TROLL LINES, REEF NETS

SALMON, CHUM OR KETA
 RANGE - OREGON TO ALASKA
 GEAR - POUND NETS, PURSE SEINES, GILL NETS,
 HAUL SEINES, REEF NETS

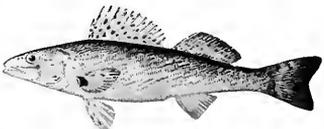

SALMON, PINK
 RANGE - WASHINGTON TO ALASKA
 GEAR - PURSE SEINES, POUND NETS, GILL NETS,
 REEF NETS

SALMON, RED OR SOCKEYE
 RANGE - OREGON TO ALASKA
 GEAR - GILL NETS, PURSE SEINES, POUND NETS,
 REEF NETS

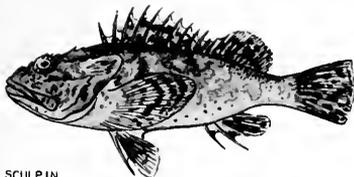

SALMON, SILVER OR COHO
 RANGE - CALIFORNIA TO ALASKA
 GEAR - HAUL SEINES, PURSE SEINES, GILL NETS,
 TROLL LINES, POUND NETS, REEF NETS

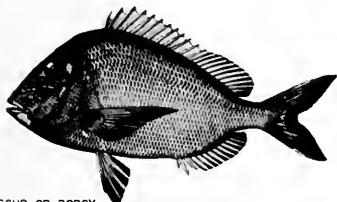

SAUGER
 RANGE - GREAT LAKES
 GEAR - GILL NETS, HAUL SEINES, TRAP NETS,
 FYKE NETS

PICTORIAL SECTION

SCULPIN
RANGE - PACIFIC COAST STATES AND ALASKA
GEAR - LINES, GILL NETS, POTS

SCUP OR PORGY
RANGE - FLORIDA TO NEW ENGLAND
GEAR - OTTER TRAWLS, POUND NETS

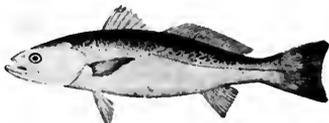

SEA BASS
RANGE - FLORIDA TO NEW ENGLAND
GEAR - OTTER TRAWLS, HANDLINES, POTS

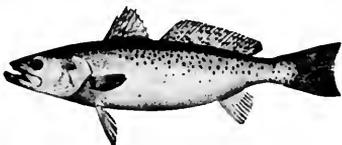

SEA CATFISH
RANGE - TEXAS TO CHESAPEAKE BAY
GEAR - OTTER TRAWLS, HAUL SEINES, HANDLINES

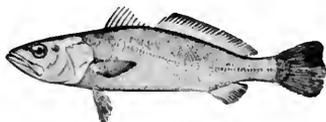

SEA ROBIN
RANGE - CHESAPEAKE BAY TO NEW ENGLAND
GEAR - POUND NETS, OTTER TRAWLS

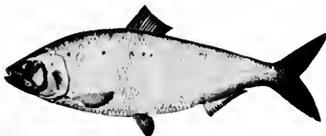

SEA TROUT OR WEAKFISH, GRAY
RANGE - FLORIDA TO MASSACHUSETTS
GEAR - OTTER TRAWLS, POUND NETS, PURSE SEINES,
GILL NETS, HAUL SEINES

SEA TROUT OR WEAKFISH, SPOTTED
RANGE - MARYLAND TO TEXAS
GEAR - GILL NETS, TRAMMEL NETS, HAUL SEINES,
POUND NETS, OTTER TRAWLS, HANDLINES

SEA TROUT OR WEAKFISH, WHITE
RANGE - GULF OF MEXICO
GEAR - GILL NETS, HAUL SEINES, HANDLINES

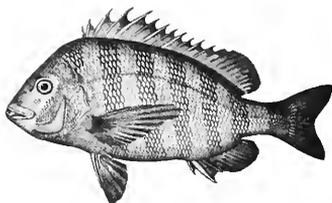

SHAD
RANGE - FLORIDA TO NEW ENGLAND
GEAR - GILL NETS, POUND NETS, FYKE NETS,
HAUL SEINES

SHARK
RANGE - ATLANTIC COAST, GULF, PACIFIC COAST STATES
GEAR - LONGLINES, GILL NETS, OTTER TRAWLS

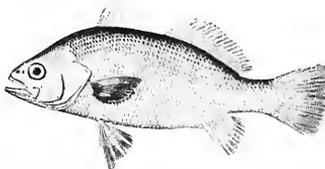

PICTORIAL SECTION

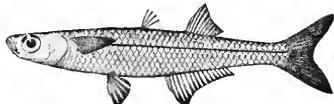

SHEEPSHEAD
 RANGE - TEXAS TO CHESAPEAKE BAY
 GEAR - HANDLINES, POTS

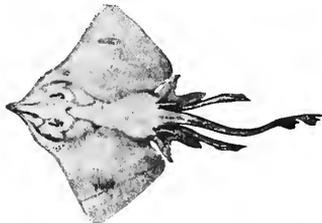

SHEEPSHEAD, CALIFORNIA
 RANGE - CALIFORNIA
 GEAR - LONGLINES, TRAMMEL NETS

SAND PERCH
 RANGE - TEXAS TO NEW YORK
 GEAR - HAUL SEINES, GILL NETS, POUND NETS

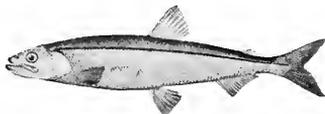

SILVERSIDES
 RANGE - NEW YORK
 GEAR - HAUL SEINES, OTTER TRAWLS

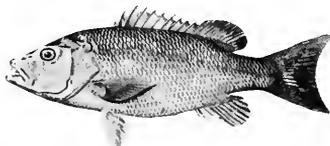

SKATE
 RANGE - PACIFIC COAST, CHESAPEAKE BAY TO NEW ENGLAND
 GEAR - LINES, OTTER TRAWLS, POUND NETS, HAUL SEINES

SKIPPER
 RANGE - VIRGINIA TO NOVA SCOTIA
 GEAR - POUND NETS, WEIRS

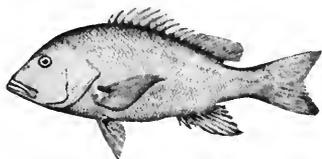

SMELT
 RANGE - NEW YORK TO MAINE, PACIFIC OCEAN,
 GREAT LAKES
 GEAR - POUND NETS, DIP NETS, GILL NETS, HAUL SEINES

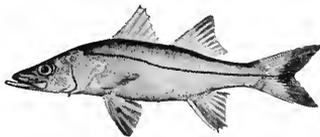

SNAPPER, MANGROVE
 RANGE - FLORIDA
 GEAR - HANDLINES, GILL NETS

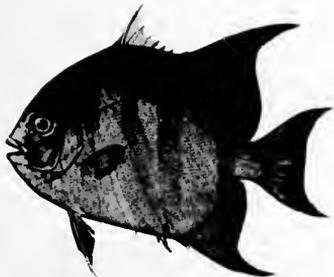

SNAPPER, LANE
 RANGE - FLORIDA
 GEAR - HANDLINES

SNAPPER, RED
 RANGE - TEXAS TO FLORIDA
 GEAR - HANDLINES

SNOOK
 RANGE - TEXAS TO FLORIDA
 GEAR - GILL NETS, HANDLINES, HAUL SEINES

SPADE FISH
 RANGE - FLORIDA
 GEAR - GILL NETS, TRAMMEL NETS

SPANISH MACKEREL
 RANGE - TEXAS TO VIRGINIA
 GEAR - GILL NETS, LINES, HAUL SEINES

SPOT
 RANGE - GULF OF MEXICO TO MIDDLE ATLANTIC STATES
 GEAR - HAUL SEINES, GILL NETS, POUND NETS,
 OTTER TRAWLS

SQUAWFISH
 RANGE - CALIFORNIA
 GEAR - FYKE NETS, GILL NETS

STEELHEAD TROUT
 RANGE - OREGON TO ALASKA
 GEAR - HAUL SEINES, POUND NETS, GILL NETS,
 LINES, DIP NETS

STRIPED BASS
 RANGE - NORTH CAROLINA TO NEW ENGLAND, CALIFORNIA
 TO OREGON
 GEAR - HAUL SEINES, GILL NETS, POUND NETS,
 HAND LINES, FYKE NETS

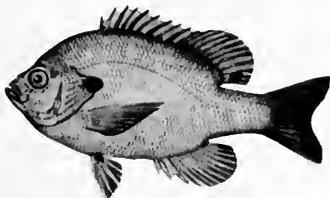

STURGEON
 RANGE - COASTAL AND RIVER AREAS
 GEAR - GILL NETS, LINES

STURGEON, SHOVELNOSE
 RANGE - FRESH-WATER
 GEAR - HAUL SEINES, LINES, POUND NETS

SUCKER
 RANGE - FRESH-WATER
 GEAR - POUND NETS, FYKE NETS, GILL NETS,
 HAUL SEINES, TRAP NETS

SUNFISH
 RANGE - FRESH-WATER
 GEAR - POTS, SEINES, TRAP NETS

SWELLFISH
 RANGE - CHESAPEAKE BAY TO MIDDLE ATLANTIC
 GEAR - POUND NETS, HAUL SEINES, OTTER TRAWLS

PICTORIAL SECTION

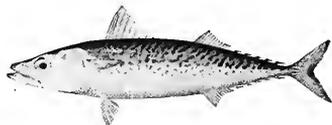

SWORDFISH
 RANGE - NEW ENGLAND AND CALIFORNIA
 GEAR - HARPOONS

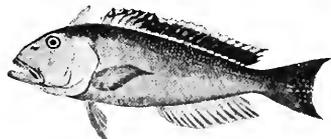

TAUTOG
 RANGE - CHESAPEAKE BAY TO NEW ENGLAND
 GEAR - POUND NETS, HANDLINES, POTS

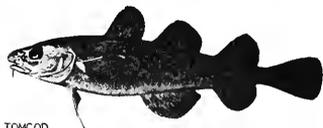

TENPOUNDER
 RANGE - FLORIDA
 GEAR - HAUL SEINES

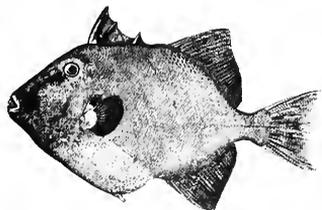

THIMBLE-EYED MACKEREL
 RANGE - CHESAPEAKE BAY TO NEW ENGLAND
 GEAR - POUND NETS, PURSE SEINES, OTTER TRAWLS

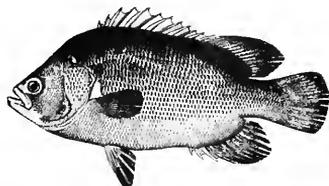

TILEFISH
 RANGE - MIDDLE ATLANTIC AND NEW ENGLAND STATES
 GEAR - LONGLINES, REEF NETS, OTTER TRAWLS

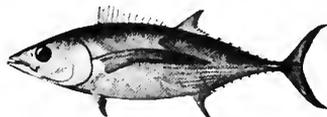

TOMCOD
 RANGE - PACIFIC COAST, MIDDLE ATLANTIC AND
 NEW ENGLAND STATES
 GEAR - OTTER TRAWLS, DIP NETS

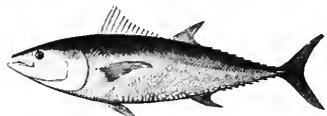

TRIGGERFISH
 RANGE - FLORIDA
 GEAR - HANDLINES

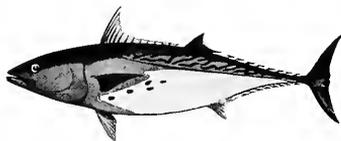

TRIPLETAIL
 RANGE - FLORIDA
 GEAR - HAUL SEINES, GILL NETS, LINES

TUNA, ALBACORE
 RANGE - PACIFIC COAST
 GEAR - LINES

TUNA, BLUEFIN
 RANGE - CALIFORNIA, NEW JERSEY TO MAINE
 GEAR - PURSE SEINES, LAMPARA NETS, TROLL LINES,
 POUND NETS, HARPOONS

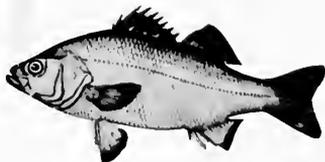

TUNA, LITTLE
 RANGE - MASSACHUSETTS TO TEXAS
 GEAR - POUND NETS, TROLL LINES, OTTER TRAWLS

PICTORIAL SECTION

TUNA, SKIPJACK
RANGE - CALIFORNIA
GEAR - LINES AND PURSE SEINES

WHITE PERCH
RANGE - NORTH CAROLINA TO MAINE
GEAR - POUND NETS, FYKE NETS, HAUL SEINES

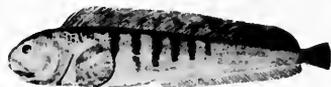

TUNA, YELLOWFIN
RANGE - PACIFIC
GEAR - LINES AND PURSE SEINES

WHITING
RANGE - VIRGINIA TO MAINE
GEAR - OTTER TRAWLS, POUND NETS

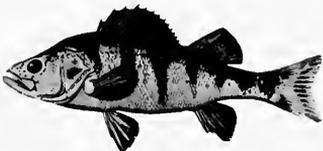

WHITE BASS
RANGE - GREAT LAKES
GEAR - TRAP NETS, FYKE NETS, HAUL SEINES,
POUND NETS

WOLFFISH
RANGE - MASSACHUSETTS AND MAINE
GEAR - OTTER TRAWLS, LONGLINES

WHITEFISH, COMMON
RANGE - GREAT LAKES
GEAR - GILL NETS, POUND NETS, TRAP NETS

YELLOW PERCH
RANGE - GREAT LAKES, OTHER LAKES
GEAR - GILL NETS, TRAP NETS, POUND NETS,
FYKE NETS

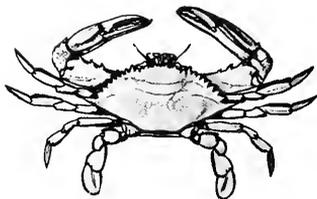

WHITEFISH, MENOMINEE
RANGE - ALASKA, GREAT LAKES
GEAR - GILL NETS, HAUL SEINES, TRAP NETS,
POUND NETS

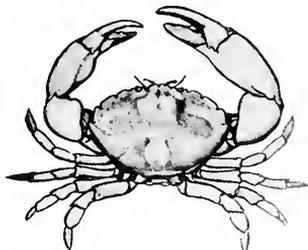

YELLOW PIKE
RANGE - GREAT LAKES
GEAR - POUND NETS, FYKE NETS, GILL NETS,
TRAP NETS

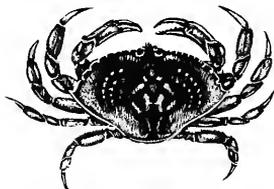

PICTORIAL SECTION

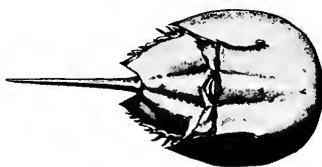

BLUE CRAB
 RANGE - TEXAS TO RHODE ISLAND
 GEAR - TROTLINE, POTS, FYKE NETS, DIP NETS,
 SCRAPES, DREDGES

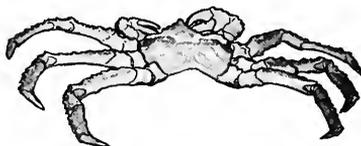

STONE CRAB
 RANGE - FLORIDA
 GEAR - DIP NETS, CRAB POTS

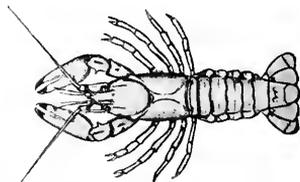

DUNGENESS CRAB
 RANGE - PACIFIC COAST STATES AND ALASKA
 GEAR - TRAPS

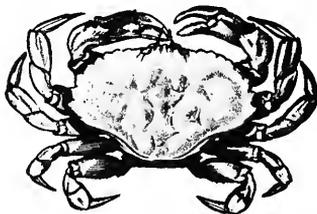

HORSESHOE CRAB
 RANGE - MARYLAND TO NEW YORK
 GEAR - POUND NETS, WEIRS, BY HAND

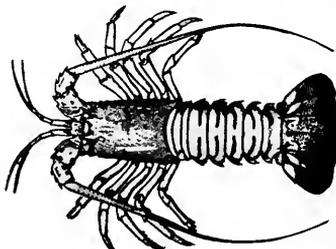

KING CRAB
 RANGE - ALASKA
 GEAR - OTTER TRAWLS

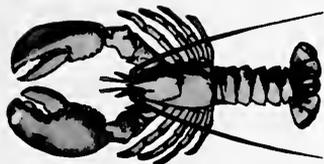

FRESH-WATER CRAWFISH
 RANGE - RIVERS AND LAKES
 GEAR - POTS

ROCK CRAB
 RANGE - NEW ENGLAND
 GEAR - POTS

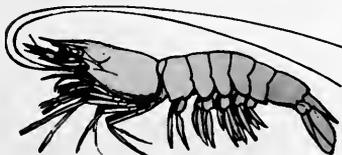

SPINY LOBSTER
 RANGE - CALIFORNIA AND FLORIDA
 GEAR - DIP NETS, POTS, HOOKS

LOBSTER, NORTHERN
 RANGE - VIRGINIA TO MAINE
 GEAR - POTS, OTTER TRAWLS

HARD CLAM
 RANGE - FLORIDA TO MAINE
 GEAR - HOES, DREOGES, TONGS, RAKES, BY HAND

SHRIMP
 RANGE - TEXAS TO NORTH CAROLINA, MAINE,
 CALIFORNIA, WASHINGTON, AND ALASKA
 GEAR - SHRIMP TRAWLS

RAZOR CLAM, PACIFIC
 RANGE - OREGON, WASHINGTON AND ALASKA
 GEAR - SHOVELS

BUTTER CLAM
 RANGE - PACIFIC COAST
 GEAR - SHOVELS

SOFT CLAM
 RANGE - MIDDLE ATLANTIC TO NEW ENGLAND,
 PACIFIC COAST STATES
 GEAR - FORKS, HOES, RAKES, DREDGES

LITTLE NECK CLAM
 RANGE - PACIFIC COAST
 GEAR - SHOVELS

CONCH
 RANGE - FLORIDA TO MAINE
 GEAR - OTTER TRAWLS, DREDGES, POTS, AND BY HAND

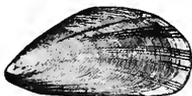

PICTORIAL SECTION

LIMPET
 RANGE - NEW YORK AND NEW ENGLAND
 GEAR - DREDGES

FRESH-WATER MUSSEL
 RANGE - FRESH-WATER STREAMS
 GEAR - CROWFOOT BARS, PICKS, HAND

SEA MUSSEL
 RANGE - NORTH CAROLINA TO MAINE
 GEAR - DREDGES, TONGS, RAKES, HAND

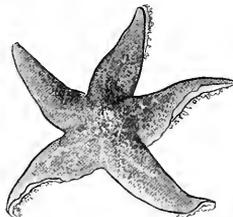

OYSTER
 RANGE - TEXAS TO MASSACHUSETTS, PACIFIC COAST
 GEAR - TONGS, DREDGES, RAKES, BY HAND

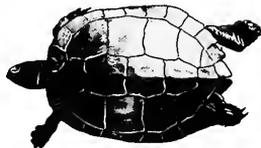

BAY SCALLOP
 RANGE - FLORIDA TO MASSACHUSETTS, WASHINGTON
 GEAR - DREDGES, SCRAPES, PUSH NETS, TONGS, RAKES,
 DIP NETS

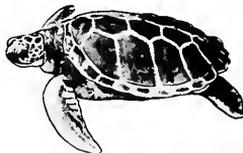

SEA SCALLOP
 RANGE - NEW JERSEY TO MAINE
 GEAR - DREDGES, OTTER TRAWLS

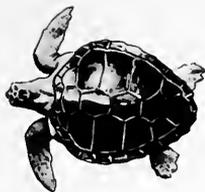

STARFISH
 RANGE - ATLANTIC AND PACIFIC COAST
 GEAR - HOOKS, SCRAPES, "MOPS"

TERRAPIN
 RANGE - TEXAS TO NEW JERSEY
 GEAR - HAUL SEINES, BY HAND

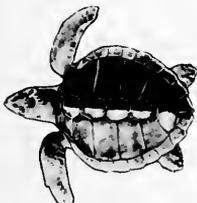

GREEN TURTLE
 RANGE - FLORIDA
 GEAR - GILL NETS

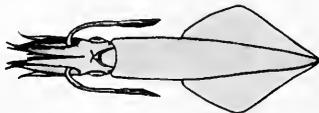

LOGGERHEAD TURTLE
 RANGE - FLORIDA TO NEW JERSEY
 GEAR - GILL NETS

FROG
 RANGE - FRESH-WATER, MARSHES, POND
 GEAR - SPEARS, GRASS

HAWKSBILL TURTLE
 RANGE - GULF OF MEXICO, AND ATLANTIC COAST
 TO NEW YORK
 GEAR - BY HAND, POUND NETS

SQUID
 RANGE - VIRGINIA TO MAINE, CALIFORNIA AND
 WASHINGTON
 GEAR - LAMPARA NETS, GILL NETS, OTTER TRAWLS,
 POUND NETS

SOFT-SHELL TURTLE
 RANGE - LAKES AND RIVERS
 GEAR - HAUL SEINES, FYKE NETS, POTS

SPONGE
 RANGE - FLORIDA
 GEAR - HOOKS, DIVING OUTFITS

IRISH MOSS
 RANGE - NEW ENGLAND
 GEAR - RAKES

SECTION 16 - STATISTICAL PUBLICATIONS

The following list of publications includes all reports issued in the Current Fishery Statistics series during 1960.

C. F. S. NO.	TITLE	C. F. S. NO.	TITLE
2205	SOUTH CAROLINA LANDINGS, NOVEMBER, 1959	2285	NEW JERSEY LANDINGS, FEBRUARY, 1960
2207	GEORGIA LANDINGS, NOVEMBER, 1959	2286	FISH MEAL AND OIL, MARCH, 1960
2208	TEXAS LANDINGS, NOVEMBER, 1959	2287	FLORIDA LANDINGS, FEBRUARY, 1960
2209	FROZEN FISH REPORT, NOVEMBER, 1959	2288	MAINE LANDINGS, FEBRUARY, 1960
2210	FISHERIES OF THE UNITED STATES AND ALASKA, ANNUAL, 1958	2289	ALABAMA LANDINGS, ANNUAL, 1959
2211	RHODE ISLAND LANDINGS, OCTOBER, 1959	2290	FROZEN FISH REPORT, APRIL, 1960
2212	FISH MEAL AND OIL, DECEMBER, 1959	2291	SHRIMP LANDINGS, ANNUAL, 1959
2213	MAINE LANDINGS, NOVEMBER, 1959	2292	NEW YORK LANDINGS, FEBRUARY, 1960
2214	NEW YORK LANDINGS, NOVEMBER, 1959	2293	RHODE ISLAND LANDINGS, FEBRUARY, 1960
2215	NORTH CAROLINA LANDINGS, DECEMBER, 1959	2294	TEXAS LANDINGS, FEBRUARY, 1960
2216	FLORIDA LANDINGS, NOVEMBER, 1959	2295	LOUISIANA LANDINGS, NOVEMBER, 1959
2217	FROZEN FISH REPORT, DECEMBER, 1959	2296	LOUISIANA LANDINGS, DECEMBER, 1959
2218	DHIO LANDINGS, NOVEMBER, 1959	2297	VIRGINIA LANDINGS, MARCH, 1960
2219	RHODE ISLAND LANDINGS, NOVEMBER, 1959	2298	MARYLAND LANDINGS, MARCH, 1960
2220	FROZEN FISH REPORT, ANNUAL, 1959	2299	SHRIMP LANDINGS, JANUARY, 1960
2221	NEW JERSEY LANDINGS, DECEMBER, 1959	2300	MASSACHUSETTS LANDINGS, JANUARY, 1960
2222	SOUTH CAROLINA LANDINGS, DECEMBER, 1959	2301	NORTH CAROLINA LANDINGS, MARCH, 1960
2223	FLORIDA LANDINGS, DECEMBER, 1959	2302	LOUISIANA LANDINGS, JANUARY, 1960
2224	NEW YORK LANDINGS, DECEMBER, 1959	2303	SOUTH CAROLINA LANDINGS, MARCH, 1960
2225	MAINE LANDINGS, DECEMBER, 1959	2304	ALABAMA LANDINGS, JANUARY, 1960
2226	OHIO LANDINGS, DECEMBER, 1959	2305	MISSISSIPPI LANDINGS, FEBRUARY, 1960
2227	RHODE ISLAND LANDINGS, DECEMBER, 1959	2306	FISH STICKS AND PORTIONS, JANUARY-MARCH, 1960
2228	FROZEN FISH REPORT, JANUARY, 1960	2307	GEORGIA LANDINGS, MARCH, 1960
2229	ALABAMA LANDINGS, OCTOBER, 1959	2308	TEXAS LANDINGS, MARCH, 1960
2230	CALIFORNIA LANDINGS, AUGUST, 1959	2309	RHODE ISLAND LANDINGS, MARCH, 1960
2231	FISH STICKS AND PORTIONS, ANNUAL, 1959	2310	CALIFORNIA LANDINGS, JANUARY, 1960
2232	SHRIMP LANDINGS, OCTOBER, 1959	2311	FLORIDA LANDINGS, MARCH, 1960
2233	CALIFORNIA LANDINGS, SEPTEMBER, 1959	2312	MAINE LANDINGS, MARCH, 1960
2234	MASSACHUSETTS LANDINGS, NOVEMBER, 1959	2313	NEW YORK LANDINGS, MARCH, 1960
2235	TEXAS LANDINGS, DECEMBER, 1959	2314	DREGG'D LANDINGS, ANNUAL, 1959
2236	GEORGIA LANDINGS, DECEMBER, 1959	2315	MASSACHUSETTS LANDINGS, FEBRUARY, 1960
2237	NEW JERSEY LANDINGS, ANNUAL, 1959	2316	ALABAMA LANDINGS, FEBRUARY, 1960
2238	NEW YORK LANDINGS, ANNUAL, 1959	2317	IMPORTS AND EXPORTS OF FISHERY PRODUCTS, ANNUAL, 1955-1959
2239	MISSISSIPPI LANDINGS, NOVEMBER, 1959	2318	VIRGINIA LANDINGS, APRIL, 1960
2240	FISH MEAL AND OIL, ANNUAL, 1959	2319	MARYLAND LANDINGS, APRIL, 1960
2241	VIRGINIA LANDINGS, JANUARY, 1960	2320	GEORGIA LANDINGS, APRIL, 1960
2242	MARYLAND LANDINGS, JANUARY, 1960	2321	NORTH CAROLINA LANDINGS, APRIL, 1960
2243	FISH MEAL AND OIL, JANUARY, 1960	2322	ALABAMA LANDINGS, MARCH, 1960
2244	CALIFORNIA LANDINGS, OCTOBER, 1959	2323	FISH MEAL AND OIL, APRIL, 1960
2245	MASSACHUSETTS LANDINGS, FEBRUARY, 1959	2324	SOUTH CAROLINA LANDINGS, APRIL, 1960
2246	MASSACHUSETTS LANDINGS BY PORTS, ANNUAL, 1959	2325	OHIO LANDINGS, MARCH, 1960
2247	NORTH CAROLINA LANDINGS, ANNUAL, 1959	2326	NEW JERSEY LANDINGS, MARCH, 1960
2248	FROZEN FISH REPORT, FEBRUARY, 1960	2327	NEW YORK LANDINGS, APRIL, 1960
2249	SOUTH CAROLINA LANDINGS, JANUARY, 1960	2328	FLORIDA LANDINGS, APRIL, 1960
2250	FLORIDA LANDINGS, ANNUAL, 1959	2329	MAINE LANDINGS, APRIL, 1960
2251	MAINE LANDINGS, BY MONTHS, ANNUAL, 1959	2330	SHRIMP LANDINGS, FEBRUARY, 1960
2252	NORTH CAROLINA LANDINGS, JANUARY, 1960	2331	NEW JERSEY LANDINGS, APRIL, 1960
2253	SOUTH CAROLINA LANDINGS, ANNUAL, 1959	2332	RHODE ISLAND LANDINGS, APRIL, 1960
2254	ALABAMA LANDINGS, NOVEMBER, 1959	2333	MISSISSIPPI LANDINGS, MARCH, 1960
2255	SHRIMP LANDINGS, NOVEMBER, 1959	2334	CALIFORNIA LANDINGS, FEBRUARY, 1960
2256	MAINE LANDINGS, BY COUNTIES AND GEAR, ANNUAL, 1959	2335	TEXAS LANDINGS, APRIL, 1960
2257	PACKAGED FISH, ANNUAL, 1959	2336	HAWAII LANDINGS, ANNUAL, 1959
2258	GEORGIA LANDINGS, ANNUAL, 1959	2337	CALIFORNIA LANDINGS, MARCH, 1960
2259	RHODE ISLAND LANDINGS, ANNUAL, 1959	2338	FROZEN FISH REPORT, MAY, 1960
2260	MASSACHUSETTS LANDINGS, BY GEAR AND SUBAREA, ANNUAL, 1959	2339	ALASKA FISHERIES, ANNUAL, 1959
2261	ALABAMA LANDINGS, DECEMBER, 1959	2340	OHIO LANDINGS, APRIL, 1960
2262	NEW JERSEY LANDINGS, JANUARY, 1960	2341	NEW JERSEY LANDINGS, MAY, 1960
2263	CALIFORNIA LANDINGS, NOVEMBER, 1959	2342	MASSACHUSETTS LANDINGS, MARCH, 1960
2264	FLORIDA LANDINGS, JANUARY, 1960	2343	SOUTH CAROLINA LANDINGS, MAY, 1960
2265	MAINE LANDINGS, JANUARY, 1960	2344	SHRIMP LANDINGS, MARCH, 1960
2266	GEORGIA LANDINGS, JANUARY, 1960	2345	VIRGINIA LANDINGS, MAY, 1960
2267	RHODE ISLAND LANDINGS, JANUARY, 1960	2346	NORTH CAROLINA LANDINGS, MAY, 1960
2268	FROZEN FISH REPORT, MARCH, 1960	2347	MISSISSIPPI LANDINGS, APRIL, 1960
2269	MISSISSIPPI LANDINGS, DECEMBER, 1959	2348	FISH MEAL AND OIL, MAY, 1960
