United States Fish and Wildlife Service
Special Scientific Report--Fisheries No. 374

Washington, D. C.
January 1961

ABSTRACT

Basic data on volumes of zooplankton off the Pacific coast in 1958 are given, together with haul data for all plankton hauls taken on survey cruises of the California Cooperative Oceanic Fisheries Investigations. Plankton volumes over the entire survey area averaged less than one-third as much as during 1951-56. Distribution charts showing relative areal zooplankton abundance by month are included.

ZOOPLANKTON VOLUMES OFF THE PACIFIC COAST, 1958

by

James R. Threlkill

Since 1949, information on zooplankton volumes obtained on CalCOFI cruises has been published annually. Eight papers have appeared in this series, six published under the authorship of "Staff of the South Pacific Fishery Investigations" and two (1957 and 1959) under the authorship of James R. Threlkill. Threlkill (1956) illustrated monthly plankton distributions for 1949 through 1955. Distribution charts have been included in subsequent reports.

The investigation of zooplankton volumes off the Pacific coast is a part of the California Cooperative Oceanic Fisheries Investigations (CalCOFI). This research is sponsored by the Marine Research Committee and carried out cooperatively by the Scripps Institution of Oceanography of the University of California, the Pelagic Fish Investigations of the California Department of Fish and Game, the California Academy of Sciences, the Hopkins Marine Station of Stanford University, and the U.S. Bureau of Commercial Fisheries Biological Laboratory, La Jolla, California. The plankton collections are obtained on oceanographic-biological survey cruises made on vessels operated by

Scripps Institution of Oceanography and the U.S. Bureau of Commercial Fisheries, Biological Laboratory, La Jolla.

The plankton samples are used by the Bureau of Commercial Fisheries in studying the early life history of commercially important, or potentially important fishes, including their distribution, abundance and rate of survival. Scripps Institution of Oceanography also makes use of the samples in studies of productivity and zoogeography.

Vessels participating in CalCOFI cruises of 1958 (table 1) included five operated by the Scripps Institution of Oceanography and one, the *Black Douglas*, operated by the Bureau of Commercial Fisheries. The stations occupied during 1958 are shown in fig. 1. A chronological list of the survey cruises made in 1958, including the area covered and the number of stations occupied on each, is given in table 2.

The plankton collecting equipment and the procedures employed in taking hauls were standard on all vessels. The nets, constructed of No. 30xxx grit gauze (a heavy-duty grade of silk bolting cloth) were 1 meter in diameter at the mouth and about 5 meters in length. All plankton hauls were taken obliquely from a depth

Note.--James R. Threlkill, Fishery Research Biologist, Bureau of Commercial Fisheries, U. S. Fish and Wildlife Service, La Jolla, California.

| November | 5811 | 80-100 | 42 |
| December | 5812 | 80-100 | 45 |

of approximately 140 meters to the surface, except in shallow water.

The volume of plankton in each sample was determined by displacement as follows: The plankton was separated from its preserving liquid (3 percent formalin) by filtering, allowed to drain, then placed into a graduated cylinder to which was added a known volume of 3 percent formalin.

Two volumes were obtained for each sample: (1) the total volume of all plankton material and (2) the volume of smaller organisms after removal of larger organisms, such as jellies, fish, squid, salps, pyrosomes, larger mollusks and larger crustaceans. Our criterion for a "larger" organism (except juvenile or adult fish) was one whose volume, as an individual, exceeded 5 cubic centimeters.

The major table in this report contains both the standardized wet plankton volume for each sample taken on routine cruises off the Pacific coast during 1958 (columns 9 and 10) and the basic information on each haul, including station number (column 1), location (columns 2 and 3), date and time of collection (columns 4, 5, and 6), volume of water strained (column 7) and the estimated depth of haul (column 8).

The average plankton volume at each station during the year is shown in figure 3. The distribution and abundance of the smaller organisms on each survey cruise are shown in figures 4 through 15. For maximum contrast, five categories of abundance are used: (1) light, 0-33 cc. of plankton, (2) moderate, 34-100 cc. of plankton, (3) average, 101-300 cc. of plankton, (4) fairly heavy, 301-900 cc. of plankton, and (5) heavy, more than 900 cc. of plankton.

Only data collected from 1951 to 1957 are used in computing long-term averages for comparative purposes. The tows of 1949 and 1950 are not included in averages because they covered only half the depth range of subsequent tows, i.e., 70 meters to the surface.

The area most consistently occupied lies between station lines 80 and 137 (fig. 1). For convenience in comparing 1958 plankton volumes with those of earlier years, this area has been divided into two roughly equal parts (lines 80-107 and lines 110-137). The northern area (lines 80-107) was occupied at monthly intervals from January through July, and October through December. The southern area (lines 110-137) was occupied at monthly intervals from January through October.

The average monthly plankton volumes for the area encompassed by lines 80-107 during 1951 through 1958 are given in table 3. The months of

August and September are not included in this table, since cruises were not made in the area during these months in recent years. Except for July and December, the monthly averages during 1958 were smaller than during any of the preceding years. Similar information for the southern area (lines 110-137) is given in table 4. Because coverage of this area during November and December was discontinued after 1955, these months have been omitted from the table.

A comparison of plankton volumes in 1958, by month and area, with the average volume of the 6-year period, 1951-56, and also with 1957, is graphically presented in fig. 2. The transition from the high volume year to low volume year is best shown by treating both 1957 and 1958 volumes separately.

In the northern area (lines 80-107) volumes during the 6-year period (1951-56) built-up to a peak in July and then receded. During 1957, volumes obtained during February through April were unusually large for these months but markedly declined thereafter giving the appearance of a summer minimum. The pattern during 1958 was similar to the 6-year period, but on a very reduced scale, since plankton volumes averaged only one-third as large. The peak month was again July.

The seasonal pattern of plankton abundance in the southern area (lines 110-137) has been somewhat similar, but the peak month has been more variable. The volumes during 1958 were fairly uniform throughout the year and were the smallest on record for the months of May through October.

The author acknowledges with pleasure the cooperation given by Scripps Institution of Oceanography in the collection of data at sea. Most personnel of the Bureau of Commercial Fisheries, Biological Laboratory, La Jolla, California, contributed to the collection, standardization and processing of plankton material.
