NOAA TECHNICAL REPORTS

National Marine Fisheries Service, Special Scientific Report—Fisheries Series

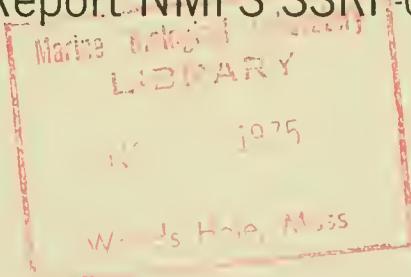

The major responsibilities of the National Marine Fisheries Service (NMFS) are to monitor and assess the abundance and geographic distribution of fishery resources, to understand and predict fluctuations in the quantity and distribution of these resources, and to establish levels for optimum use of the resources. NMFS is also charged with the development and implementation of policies for managing national fishing grounds, development and enforcement of domestic fisheries regulations, surveillance of foreign fishing off United States coastal waters, and the development and enforcement of international fishery agreements and policies. NMFS also assists the fishing industry through marketing service and economic analysis programs, and mortgage insurance and vessel construction subsidies. It collects, analyzes, and publishes statistics on various phases of the industry.

The Special Scientific Report—Fisheries series was established in 1949. The series carries reports on scientific investigations that document long-term continuing programs of NMFS, or intensive scientific reports on studies of restricted scope. The reports may deal with applied fishery problems. The series is also used as a medium for the publication of bibliographies of a specialized scientific nature.

NOAA Technical Reports NMFS SSRF are available free in limited numbers to governmental agencies, both Federal and State. They are also available in exchange for other scientific and technical publications in the marine sciences. Individual copies may be obtained (unless otherwise noted) from D83, Technical Information Division, Environmental Science Information Center, NOAA, Washington, D.C. 20235. Recent SSRF's are:

619. Macrozooplankton and small nekton in the coastal waters off Vancouver Island (Canada) and Washington, spring and fall of 1963. By Donald S. Day, January 1971. iii + 94 p., 19 figs., 13 tables.

Daily and Weekly Upwelling Indices, West Coast of North America, 1967-73

ANDREW BAKUN¹

ABSTRACT

Daily and weekly indices of intensity of large-scale wind-induced coastal upwelling at selected locations along the west coast of North America are presented for the 7-yr period, 1967-73. The indices are based on 6-hourly computations of the offshore component of Ekman transport using the synoptic surface atmospheric pressure analyses produced by the Fleet Numerical Weather Central to estimate the sea surface stress. The magnitude of offshore transport is considered an indication of resultant upwelling through the bottom of the Ekman layer. A spatial distortion in absolute magnitude results in noncomparability of numerical values between different locations.

INTRODUCTION

Upwelling is a highly variable phenomena which can have important effects on fishery resources. As an aid in accounting for these effects, Bakun (1973) presented monthly indices of intensity of wind-induced coastal upwelling at intervals of three degrees latitude along the west coast of North America. This choice of time scale recognized that although important variations in the upwelling process are known to occur on time scales shorter than a month, specification on shorter scales often may not be required or even desired. Some major effects of upwelling occur at the very base of the food chain and are separated from the harvested resource by a considerable time lag and by multiple interacting biological processes. Where such extended linkages are involved, attempts to relate individual short-term upwelling events to characteristics of a subsequent fishery are likely to be unrewarding.

However, over longer time scales the mean value may be less important than the frequency content of the distribution from which the mean was formed. For example, a month of continual, fairly steady upwelling activity may have a mean rate of upward transfer similar to another month in which nearly all the upwelling occurs in one short, very intense burst. However, the responses of the biota in the two cases might be quite different. In addition, there are certain applications to which detailed specifications of individual upwelling events are pertinent. For instance, the life history of a particular organism may be such that a crucial process takes place within a definable, short time period. In cases where tactical fishing success is related to upwelling conditions, an indication of short-term variations in upwelling may aid in formulating fishing strategy and in interpreting catch data. Multidisciplinary investigations such as the CUE experiments (O'Brien and Smith 1971) promise new insights into the mechanisms linking upwelling phenomena to fishery resources. Early application of results of such efforts may be facilitated by having descriptive indicators available which are compatible with the short time

scales of the experiments but which are independent of a particular observational program and can be extended to the larger time and space scales involved in most fishery problems.

This report presents daily and weekly means of upwelling indices computed at 6-hr intervals over the 7-yr period, 1967 through 1973. The input data are synoptic surface atmospheric pressure fields. The calculation procedures and the locations (Fig. 1) are identical to those used by Bakun (1973). However, in the present case a lower value for the drag coefficient, corresponding to the use of synoptic rather than monthly mean input data, is used to estimate the stress of the wind on the sea surface.

METHOD

The procedure for calculating upwelling indices is presented in detail by Bakun (1973). Six-hourly synoptic surface atmospheric pressure fields prepared by Fleet Numerical Weather Central (FNWC) are arranged on the 3-degree mesh length grid shown in Figure 1. Finite difference derivatives are formed and the geostrophic wind is calculated. An estimate of the wind field near the sea surface is made by rotating the geostrophic wind 15 degrees to the left and reducing its magnitude by 30% to approximate frictional effects. The sea surface stress field is computed according to

$$\vec{\tau} = \rho_a C_d |\vec{v}| \vec{v} \quad (1)$$

where $\vec{\tau}$ is the stress vector, ρ_a is the density of air, C_d is an empirical drag coefficient, \vec{v} is the estimated wind vector near the sea surface with magnitude $|\vec{v}|$.

The resultant transport in the surface layer of the ocean is calculated from

$$\vec{M} = \frac{1}{f} \vec{\tau} \times \vec{k} \quad (2)$$

where \vec{M} is the Ekman mass transport, f is the Coriolis parameter, and \vec{k} is a unit vector directed vertically upward. The component of computed Ekman transport directed off shore is termed the *upwelling index* and is considered an indication of the rate of upwelling of deeper

waters to replace those driven offshore by the stress of the wind. The characteristic coastline orientations used to resolve the offshore component are listed in Table 1.

Constants Employed in the Stress Calculation

Following the procedure of Fofonoff (1960),² the density of air used in Equation (1) was considered to have a constant value of $0.00122 \text{ g cm}^{-3}$. This is very near to the U.S. standard atmosphere sea level air density value ($0.001226 \text{ g cm}^{-3}$) chosen by the U.S. Weather Service as representing average conditions over the United States at lat 40° N .

The drag coefficient, C_d , was considered to be a constant equal to 0.0013. Recent research (Davidson 1974) has demonstrated dependence of the drag coefficient both on atmospheric stability and on spectral properties of the ocean waves. However, a generally agreed-upon formulation does not appear well enough established at this time to warrant attempting to incorporate these effects in the computations of upwelling indices. The value 0.0013 is within the range of recent estimates for constant drag coefficients. DeLeonibus (1971) gives 0.0012 ± 0.0004 as characteristic of constant drag coefficients measured in neutrally stable conditions from the Argus Island tower off Bermuda. Denman and Miyake (1973) arrive at 0.00163 ± 0.00028 , with no observed dependence on stability, from measurements at ocean station Papa. For our purposes, the absolute value is less important than intercomparability among various data sets. The value 0.0013 was used by Bakun, McLain, and Mayo (1974) in a climatological study, and is compatible with Bakun's (1973) discussion of the effect of monthly mean data on such computations.

Atmospheric Pressure Data

The choice of time scale (6-hr) and space scale (3-degree grid mesh) used in the calculations is largely dictated by the time and space distributions of the basic observational data. Meteorological observations are commonly made and collected via the international data network at 6-hr intervals. By convention, the times of observation are at 0000, 0600, 1200, and 1800 Greenwich mean time. The derived distributions are properly viewed as simultaneous instantaneous samplings rather than as averages over any time interval. Any averaging which may take place as part of a measurement procedure is intended merely as a means of filtering the very small-scale turbulent variations (having periods less than

several minutes) in order to reveal the underlying larger scale patterns which are of interest.

A typical distribution of pressure observations over the northeast Pacific Ocean for a particular 6-hr sampling (Fig. 2) suggests futility in attempting to resolve details in the distribution on a scale much smaller than three degrees. On any scale much larger than this, however, important features of coastline trend are lost.

The method of atmospheric pressure analysis presently in use at FNWC is described by Holl and Mendenhall (1972). The method not only incorporates pressure reports but also accompanying wind reports in the form of equivalent pressure gradients. The result thus reflects a greater amount of observational data than would a separate analysis of either pressure or wind. Objective forecast procedures are applied to the previous analysis (6 h earlier) to supply additional information.

About 1% of the 6-hourly synoptic sea-level pressure

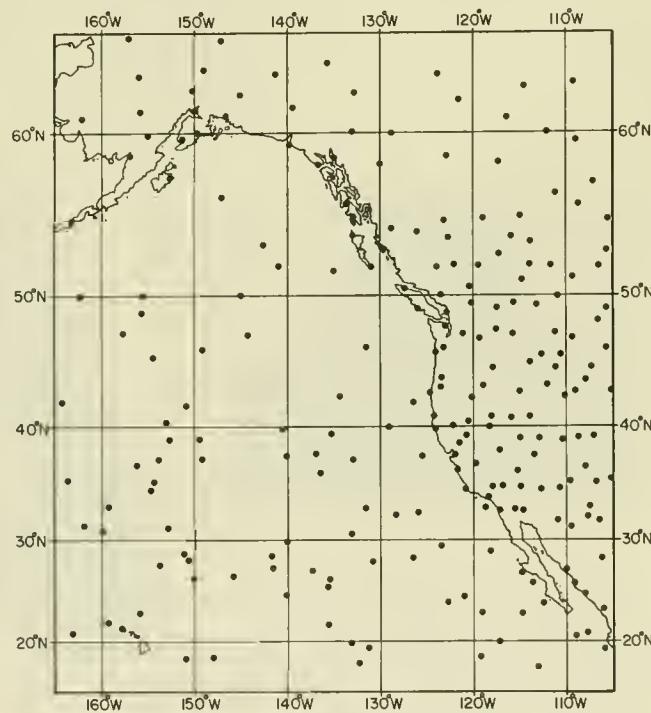

Figure 2.—Distribution of observations made at 1800 GMT, 5 January 1974, which arrived at the Fleet Numerical Weather Central in time for incorporation in the operational surface pressure analysis.

²Fofonoff, N.P. 1960. Transport Computations for the North Pacific Ocean-1958. Fish. Res. Board Can., Manuscr. Rep. (Oceanogr. Limnol.) 80, 81 p.

fields during the 7-yr period were missing from the FNWC archives. Certain of the missing fields had been rejected as erroneous. Some had been lost due to various equipment failures. As a result, some 113 of the daily averages reflect only three of the four daily synoptic periods, 15 contain two of four, and 2 contain only one. The days for which the daily averages represent less than all four synoptic samplings are listed in Table 2.

Distortion of Spatial Distributions

Bakun (1973) listed two sources of distortion in the spatial distributions of upwelling intensity indicated by the monthly indices presented therein. In that case monthly mean pressure data were used for the purpose of extending the series back through 1946 in a reasonably consistent manner. A major distorting effect was attributed to the use of mean data in conjunction with the nonlinear stress law (Equation (1)), resulting in an underestimate which depended on the variability of the wind field during the month. To partially compensate for underestimating the mean stress, a high value (0.0026) of the drag coefficient was used. Since the normal variability differs among different geographical areas, indicated upwelling at certain locations was amplified relative to other locations. The series presented here cover 7 yr, for which there are available a quite complete and internally consistent set of 6-hourly synoptic pressure analyses. Thus, there is no need to resort to mean data and that particular source of distortion is not encountered.

The second source of spatial distortion discussed by Bakun (1973) applies also in the present case. This involves a

discontinuity in the onshore-offshore sea-level atmospheric pressure gradient caused by the coastal mountain ranges. In the interior valley of southern California, in particular, an intense localized thermal low develops during the summer. Because of the 3-degree mesh length of the computation grid, the effect of this low on the computed indices may be amplified relative to its actual effect on the wind stress field on the coastal side of the mountain range.

This effect can be illustrated by comparing the distribution of means by month and location of the 6-hourly upwelling indices to a corresponding summary of offshore Ekman transports produced from actual wind observations made by ships at sea. Figure 3(a) displays the annual cycle obtained by Bakun et al. (1974). The figure summarizes over 75,000 individual wind reports from the National Climatic Center's file of marine surface observations over the 20-yr period, 1948 through 1967, within the 1-degree squares (Figure 3(c)). The Ekman transport was computed for each wind observation and the offshore components, grouped by long-term month and by 1-degree square, were averaged. Figure 3(b) displays time-series isograms of the 7-yr (1967-73) mean monthly values of the 6-hourly upwelling indices. Some of the detail apparent in Figure 3(a) is smoothed out in Figure 3(b) because the upwelling indices are computed at 3-degree intervals using derivatives computed across a 6-degree length scale whereas the averages making up Figure 3(a) were formed at 1-degree intervals and contain data only from the surrounding 1-degree square. However, comparison of the two figures indicates a definite southward shift of the region of maximum magnitude of the upwelling indices. The indica-

tion is that although the 6-hourly upwelling indices may be satisfactory indicators of temporal variations at individual locations, they give a distorted picture of spatial variations.

DISCUSSION

A conspicuous feature of the charts in the appendix is the apparent variability of the upwelling process. A substantial component of this variability is the seasonal cycle, the major

features of which appear to be repeated from year to year. Clearly evident on a much shorter time scale, characteristically of one to several days, are individual "events" which seem randomly superimposed on the seasonal variation. Between these extremes of scale lie features which appear as clusters of events. These are the subject of further study and will be reported elsewhere (e.g., Bakun 1974) as will the diurnal periodicities which exist in the 6-hourly data but do not appear in the daily means presented here.

Table 3 gives the 7-yr mean values by month of the daily mean indices. Table 4 gives the corresponding mean values of the weekly mean indices. The values in Tables 3 and 4 are, of course, nearly identical, differing only in that a given weekly mean may overlap two consecutive months. Figure

3(b) is well representative of both sets. The southern portion is primarily an area of positive mean values of the indices indicating upwelling conditions on the average throughout the year. The northern portion is primarily a region of average downwelling (negative indices). Maximum mean

Table 3.—Seven-year (1967-73) composite monthly averages of daily means of 6-hourly upwelling indices. Units are cubic meters per second per 100 m of coastline.

seasonal values appear earliest to the south, i.e., in April at lat. 21°N, and appear progressively later to the north. Maxima are in May off southern California and in June and July from central California to the northern extremity of the Gulf of Alaska. Minimum mean seasonal values appear during winter as strong negatives (intense downwelling) in the north and as weak positives (relaxed upwelling) toward the south. At the southern extreme the seasonal minimum is in the fall, indicating downwelling conditions on the average during September and October at lat. 21°N. In general, the timing and duration of the upwelling seasons indicated by these series differ very little from those reported by Bakun (1973).

The seasonal distributions of variance in the daily and weekly values are tabulated in terms of standard deviations in Tables 5 and 6. High variances in the daily means are indicated during the winter downwelling season in the Gulf of Alaska. The coast of northern California appears as a region of high variability throughout the year. The most stable situation appears to be the summer season in the north. The distributions of variance of the weekly values tend to be similar to those of the daily values. However, the numerical values are markedly lower, indicating major contributions by shorter term fluctuations in all seasons and locations.

As mentioned in the introduction, the very short-term variability may not be of great concern in many applications. Many of the processes involved are probably sufficiently linear that averages over weekly periods and perhaps monthly periods will provide relevant information. The daily and weekly indices presented in this report, and the monthly, quarterly, and yearly indices presented by Bakun (1973) are intended to provide a choice of scales to users, which may enhance the usefulness and ease of application of this information to fishery problems.

ACKNOWLEDGMENT

Atmospheric pressure analyses and electronic computing and plotting facilities were provided by the U.S. Navy, Fleet Numerical Weather Central.

APPENDIX

Tabulation and Plots of Daily and Weekly Upwelling Indices

The following pages display daily and weekly means of 6-hourly upwelling index computations at 15 near coastal locations (see text Fig. 1) over the 7-yr period, 1967-73. The display for each location occupies seven consecutive pages, one page per year.

The left column indicates the calendar date of the Sunday which begins a particular week. The seven columns to the right contain the daily averages progressing from Sunday through the following Saturday. Each daily average summarizes the synoptic computations at 4 AM, 10 AM, 4 PM, and 10 PM Pacific Standard Time. The average of the seven daily mean values is listed in the right column of numbers.

The units are metric tons per second per 100 m of coast-

line. These units may be thought of as the average amount (metric tons or cubic meters) of water upwelled through the bottom of the Ekman layer each second along each 100 m of a straight line directed along the dominant trend of the coast on a scale of about 200 miles. Because of uncertainties in some of the constants employed and for other reasons outlined in this report, it may be well to consider these indices as indicative of relative fluctuations rather than as quantitative measures of absolute magnitude.

To the right of each weekly row of numerical values, the daily values are plotted as horizontal lines, and the weekly means as vertical bars. Where a given value is so large that the plotted line would extend off the graph, truncation of the line is indicated by an "X".

648. Weight loss of pond raised channel catfish (*Ictalurus punctatus*) during holding in processing plant vats. By Donald C. Greenland and Robert L. Gill. December 1971, iii + 7 p., 3 figs., 2 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
649. Distribution of forage of skipjack tuna (*Euthynnus pelamis*) in the eastern tropical Pacific. By Maurice Blackburn and Michael Laurs. January 1972, iii + 16 p., 7 figs., 3 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
650. Effects of some antioxidants and EDTA on the development of rancidity in Spanish mackerel (*Scomberomorus maculatus*) during frozen storage. By Robert N. Farragut. February 1972, iv + 12 p., 6 figs., 12 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
651. The effect of premortem stress, holding temperatures, and freezing on the biochemistry and quality of skipjack tuna. By Ladell Crawford. April 1972, ii + 23 p., 3 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
653. The use of electricity in conjunction with a 12.5-meter (Headrope) Gulf-of-Mexico shrimp trawl in Lake Michigan. By James E. Ellis. March 1972, iv + 10 p., 11 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
654. An electric detector system for recovering internally tagged menhaden, genus *Brevoortia*. By R. O. Parker, Jr. February 1972, iii + 7 p., 3 figs., 1 appendix table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
655. Immobilization of finerling salmon and trout by decompression. By Doyle F. Sutherland. March 1972, iii + 7 p., 3 figs., 2 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
656. The calico scallop, *Argopecten gibbus*. By Donald M. Allen and T. J. Costello. May 1972, iii + 19 p., 9 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
657. Making fish protein concentrates by enzymatic hydrolysis. A status report on research and some processes and products studied by NMFS. By Malcolm B. Hale. November 1972, v + 32 p., 15 figs., 17 tables, 1 appendix table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
658. List of fishes of Alaska and adjacent waters with a guide to some of their literature. By Jay C. Quast and Elizabeth L. Hall. July 1972, iv + 47 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
659. The Southeast Fisheries Center bionumeric code. Part I: Fishes. By Harvey R. Bullis, Jr., Richard B. Roe, and Judith C. Gatlin. July 1972, xl + 95 p., 2 figs. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
660. A freshwater fish electro-motivator (FFEM)-its characteristics and operation. By James E. Ellis and Charles C. Hoopes. November 1972, iii + 11 p., 9 figs.
661. A review of the literature on the development of skipjack tuna fisheries in the central and western Pacific Ocean. By Frank J. Hester and Tamio Otsu. January 1973, iii + 13 p., 1 fig. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
662. Seasonal distribution of tunas and billfishes in the Atlantic. By John P. Wise and Charles W. Davis. January 1973, iv + 24 p., 13 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
663. Fish larvae collected from the northeastern Pacific Ocean and Puget Sound during April and May 1967. By Kenneth D. Waldron. December 1972, iii + 16 p., 2 figs., 1 table, 4 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington D.C. 20402.
664. Tagging and tag recovery experiments with Atlantic menhaden, *Brevoortia tyrannus*. By Richard L. Kroger and Robert L. Dryfoos. December 1972, iv + 11 p., 4 figs., 12 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
665. Larval fish survey of Humboldt Bay, California. By Maxwell B. Eldridge and Charles F. Bryan. December 1972, iii + 8 p., 8 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
666. Distribution and relative abundance of fishes in Newport River, North Carolina. By William R. Turner and George N. Johnson. September 1973, iv + 23 p., 1 fig., 13 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
667. An analysis of the commercial lobster (*Homarus americanus*) fishery along the coast of Maine, August 1966 through December 1970. By James C. Thomas. June 1973, v + 57 p., 18 figs., 11 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
668. An annotated bibliography of the cunner, *Tautogolabrus adspersus* (Walbaum). By Fredrie M. Serchuk and David W. Frame. May 1973, ii + 43 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
669. Subpoint prediction for direct readout meteorological satellites. By L. E. Eber. August 1973, iii + 7 p., 2 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
670. Unharvested fishes in the U.S. commercial fishery of western Lake Erie in 1969. By Harry D. Van Meter. July 1973, iii + 11 p., 6 figs., 6 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
671. Coastal upwelling indices, west coast of North America, 1946-71. By Andrew Bakun. June 1973, iv + 103 p., 6 figs., 3 tables, 45 appendix figs. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
672. Seasonal occurrence of young Gulf menhaden and other fishes in a northwestern Florida estuary. By Marlin E. Tagatz and E. Peter H. Wilkins. August 1973, iii + 14 p., 1 fig., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
673. Abundance and distribution of inshore benthic fauna off southwestern Long Island, N.Y. By Frank W. Steimle, Jr. and Richard B. Stone. December 1973, iii + 50 p., 2 figs., 5 appendix tables.
674. Lake Erie bottom trawl explorations, 1962-66. By Edgar W. Bowman. January 1974, iv + 21 p., 9 figs., 1 table, 7 appendix tables.
675. Proceedings of the International Billfish Symposium, Kailua Kona, Hawaii, 9-12 August 1972. Part 2. Review and Contributed Papers. Richard S. Shomura and Francis Williams (editors). July 1974, iv + 335 p., 38 papers. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
676. Price spreads and cost analyses for finfish and shellfish products at different marketing levels. By Erwin S. Penn. March 1974, vi + 74 p., 15 figs., 12 tables, 12 appendix figures, 41 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
677. Abundance of benthic macroinvertebrates in natural and altered estuarine areas. By Gill Gilmore and Lee Trent. April 1974, iii + 13 p., 11 figs., 3 tables, 2 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
678. Distribution, abundance, and growth of juvenile sockeye salmon, *Oncorhynchus nerka*, and associated species in the Naknek River system, 1961-64. By Robert J. Ellis. September 1974, v + 53 p., 27 figs., 26 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
679. Kinds and abundance of zooplankton collected by the USCG icebreaker *Glacier* in the eastern Chukchi Sea, September-October 1970. By Bruce L. Wing. August 1974, iv + 18 p., 14 figs., 6 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
680. Pelagic amphipod crustaceans from the southeastern Bering Sea, June 1971. By Gerald A. Sanger. July 1974, iii + 8 p., 3 figs., 3 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
681. Physiological response of the cunner, *Tautogolabrus adspersus*, to cadmium. October 1974, iv + 33 p., 6 papers, various authors. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
682. Heat exchange between ocean and atmosphere in the eastern North Pacific for 1961-71. By N. E. Clark, L. Eber, R. M. Laurs, J. A. Renner, and J. F. T. Saur. December 1974, iii + 108 p., 2 figs., 1 table, 5 plates.
