NOAA TECHNICAL REPORTS

National Marine Fisheries Service, Special Scientific Report—Fisheries

The major responsibilities of the National Marine Fisheries Service (NMFS) are to monitor and assess the abundance and geographic distribution of fishery resources, to understand and predict fluctuations in the quantity and distribution of these resources, and to establish levels for optimum use of the resources. NMFS is also charged with the development and implementation of policies for managing national fishing grounds, development and enforcement of domestic fisheries regulations, surveillance of foreign fishing off United States coastal waters, and the development and enforcement of international fishery agreements and policies. NMFS also assists the fishing industry through marketing service and economic analysis programs, and mortgage insurance and vessel construction subsidies. It collects, analyzes, and publishes statistics on various phases of the industry.

The Special Scientific Report—Fisheries series was established in 1949. The series carries reports on scientific investigations that document long-term continuing programs of NMFS, or intensive scientific reports on studies of restricted scope. The reports may deal with applied fishery problems. The series is also used as a medium for the publication of bibliographies of a specialized scientific nature.

NOAA Technical Reports NMFS SSRF are available free in limited numbers to governmental agencies, both Federal and State. They are also available in exchange for other scientific and technical publications in the marine sciences. Individual copies may be obtained (unless otherwise noted) from D825, Technical Information Division, Environmental Science Information Center, NOAA, Washington, D.C. 20235. Recent SSRFs are:

649. Distribution of forage of skipjack tuna (*Euthynnus pelamis*) in the eastern tropical Pacific. By Maurice Blackburn and Michael Laurs. January 1972, iii + 16 p., 7 figs., 3 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
650. Effects of some antioxidants and EDTA on the development of rancidity in Spanish mackerel (*Scomberomorus maculatus*) during frozen storage. By Robert N. Farragut. February 1972, iv + 12 p., 6 figs., 12 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
651. The effect of premortem stress, holding temperatures, and freezing on the biochemistry and quality of skipjack tuna. By Ladell Crawford. April 1972, iii + 23 p., 3 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
653. The use of electricity in conjunction with a 12.5-meter (Headrope) Gulf-of-Mexico shrimp trawl in Lake Michigan. By James E. Ellis. March 1972, iv + 10 p., 11 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
654. An electric detector system for recovering internally tagged menhaden, genus *Brevoortia*. By R. O. Parker, Jr. February 1972, iii + 7 p., 3 figs., 1 app. table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
655. Immobilization of fingerling salmon and trout by decompression. By Doyle F. Sutherland. March 1972, iii + 7 p., 3 figs., 2 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
656. The calico scallop, *Argopecten gibbus*. By Donald M. Allen and T. J. Costello. May 1972, iii + 19 p., 9 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
657. Making fish protein concentrates by enzymatic hydrolysis. A status report on research and some processes and products studied by NMFS. By Malcolm B. Hale. November 1972, v + 32 p., 15 figs., 17 tables, 1 app. table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
658. List of fishes of Alaska and adjacent waters with a guide to some of their literature. By Jay C. Quast and Elizabeth L. Hall. July 1972, iv + 47 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Midwater Invertebrates from the Southeastern Chukchi Sea: Species and Abundance in Catches Incidental to Midwater Trawling Survey of Fishes, September-October 1970

BRUCE L. WING and NANCY BARR¹

ABSTRACT

Midwater invertebrates were collected in the southeastern Chukchi Sea. A 1.8-m Isaacs-Kidd midwater trawl was used at 20 stations to collect 81 semiquantitative samples; a 3-m otter trawl was used at one station to collect two qualitative samples. Data tables list the species collected and their numbers, size range, and displacement volumes for the midwater trawl stations and a species list only for the otter trawl station. One hundred three species of invertebrates were identified from the midwater trawl samples, and 33 species were identified from the otter trawl samples. Amphipods were the most diverse group (40 species) and decapod shrimps the next most diverse (14 species). Numbers of species in a sample varied from 4 to 40 (mean 17). After removal of jellyfishes, the most important contributors in numbers and volume to the catches were euphausiids and mysids.

INTRODUCTION

The Western Beaufort Sea Ecological Cruises (WEBSEC) were a sequence of oceanographic cruises sponsored by the U.S. Coast Guard to assess the Alaskan arctic marine environment and biota before major industrial development. The Coast Guard enlisted the efforts of federal, state and university research groups for the program, and the National Marine Fisheries Service contributed to the first three cruises with studies of zooplankton, midwater invertebrates, and fishes.

The intent of the first cruise, WEBSEC-70, which took place during September and October 1970, was to examine the arctic coast from Barrow eastward to Barter Island. Extremely heavy ice conditions in mid-September 1970 prevented the Icebreaker *Glacier* from working in the Beaufort Sea; therefore, an alternative area, the southeastern Chukchi Sea between Point Lay and Cape Lisburne (Fig. 1) was surveyed between 25 September and 17 October. Preliminary results of physical, chemical, geological, and biological investigations for WEBSEC-70 were reported by Ingham et al. (1972); and reports were later published by Quast (1974) and Wing (1974).

This report presents data on the invertebrates taken in midwater trawls made to collect fishes from 25 September to 17 October 1970. The data are presented in tabular form and are not interpreted, although some apparent sampling anomalies are discussed. The tables provide a list of species found, numbers of individuals taken, and linear size range and displacement volume of the

specimens of each species. These data are the first attempts to quantitatively assess macroplanktonic and micronektonic invertebrates in the southeastern Chukchi Sea.

METHODS

A 1.8-m Isaacs-Kidd midwater trawl was used to sample at 20 stations for a total of 81 tows (Fig. 1, Appendix Table 1). The trawl had a forward section of 38-mm bar mesh, a rear section of 6-mm bar mesh, and a cod end of 3-mm bar mesh. Cross-sectional areas were calculated to be 2.87 m² at the mouth, 1.55 m² at the beginning of the 6-mm mesh, and 0.13 m² at the beginning of the 3-mm mesh. The depth of tow was recorded by a bathygraph attached to the bottom of the depressor. Tows were standardized for a length of 3.7 km at an estimated vessel speed of 4 knots. At least four tows were made at each of the 20 stations, two on one bearing and two on the reciprocal bearing. Trawling was generally done at night in areas relatively free of ice. The choice of sampling depths was dependent on water depths and on whether or not the samples were intended to be replicates or were to examine depth distributions (Quast 1974).

At one station (No. 8—Fig. 1) two trawls were made with a 3-m, 38-mm mesh otter trawl (shrimp try net) to collect bottom fishes and invertebrates.

Large scyphomedusans and most hydromedusans taken in the trawls were discarded in the field after the sizes and numbers of each species of scyphomedusan and the volumes of hydromedusans had been recorded. The other invertebrates were preserved in 5% Formalin.

In preparation for examining the invertebrates in the laboratory, formalin was washed from the samples and

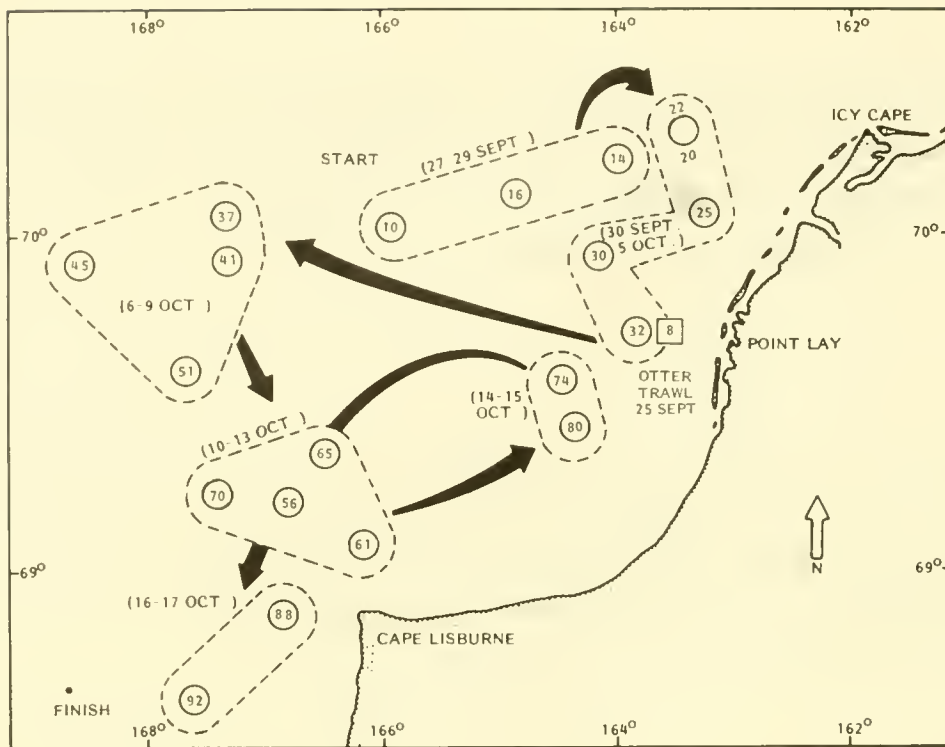

Figure 1.—Positions and sequence of trawling stations during WEBSEC-70. Circles indicate stations where Isaacs-Kidd midwater trawl was used; squares indicate otter trawl was used. (From Quast, 1972.)

they were stored in 40% isopropyl alcohol. Each sample was examined first in its entirety for rare species. For small samples, total counts were made for each species of invertebrate, and maximum and minimum size ranges were recorded. When large numbers of euphausiids or mysids were present, the collections were subsampled with a Folsom plankton splitter (McEwen et al. 1954). The subsamples always contained more than 500 individuals.

Identifications (to species when possible) were based on the following taxonomic references: Banner (1948a, 1948b, 1950, 1954); Barnard (1958, 1962a, 1962b, 1962c, 1964, 1973); Boden et al. (1955); Bowman (1973, 1960); Brodskii (1950); Coe (1904, 1905); Dawson (1971); Dunbar (1954); Gurjanova (1951); Holmquist (1959, 1965); Leung (1971); G. E. MacGinitie (1955); N. MacGinitie (1959); Naumov (1960); Rathbun (1904); Sars (1895, 1900); Shoemaker (1955); Vanhöffen (1906); and Zimmer (1926). Except for decapod shrimps, lengths are greatest body lengths to the nearest millimeter and do not include antennae, rostra, or tentacles. Decapod shrimp lengths are for the carapace (insertion of eye to dorsal posterior margin). Displacement volumes to the nearest 0.5 ml were taken on the drained lots of each species sorted from a sample. The volumes were measured with 10-, 25-, 100-, or 500-ml graduated cylinders. All sorting and measuring was done 1-4 yr after the specimens were collected; thus shrinkage due to preservation was stabilized. Displacement volumes were obtained only for samples processed in the last 4 mo of sorting.

RESULTS

The 81 samples from the 20 midwater trawl stations contained 103 specimens of invertebrates (Table 1). Amphipods had the greatest number of species (35) and decapod shrimps the second largest (14). The number of invertebrate species per sample ranged from 4 to 40 (mean, 17). The scyphomedusans and hydromedusans discarded in the field contributed most to the volume of the catches. In the preserved material, euphausiids and mysids were the most abundant invertebrates and the major contributors to the biomass (Appendix Table 2).

Thirty-three species of invertebrates were identified from the two samples taken by the 3-m otter trawl at station 8 (Table 2). The list of invertebrate species from station 8 plus the benthic invertebrates taken in the midwater trawl samples supplement the more extensive lists of benthic invertebrates from the southeastern Chukchi Sea given by McCauley (1964), Sparks and Pereyra (1966), and Naidu and Sharma (1972). Three species of gastropods, 4 bivalves, 2 mysids, 2 isopods, 12 amphipods, 9 decapod crustaceans, and 1 ascidian were collected by the otter trawl.

DISCUSSION

The three sizes of meshes in the Isaacs-Kidd midwater trawl used in the sampling were 3-mm cod end, 6-mm rear section, and 38-mm forward section. Some of the invertebrates captured were so small that many of them undoubtedly passed through the larger meshes. Al-

¹Family name. Parasitic on mysids.²Family name.³Tribe name. Within the brachyuran larvae, no attempt was made to separate species. Searches through selected samples yielded both *Chionoecetes opilio* (O. Fabricius) and *Hyas coarctatus* Leach.⁴Subtribe name. Within the pagurideans, no attempt was made to distinguish between zoaeae of Paguridae (family name) and Lithodidae (family name). Glaucothoe were all Paguridae.⁵Genus and species undetermined.

though the resulting catches should be considered only as semiquantitative, they do provide indicators of the kinds and general quantities of midwater invertebrates present in the southeastern Chukchi Sea.

The terms mesoplankton, macroplankton, micronekton, and benthos may be applied to various grouping of invertebrates collected with the Isaacs-Kidd midwater trawl in the Chukchi Sea during WEBSEC-70. None of the terms are precisely defined, but they provide criteria for evaluation of catches by those who may wish to compare the species and quantities reported in Appendix Table 2 with other sets of data.

Mesoplankters are zooplankters quantitatively retained by a 0.2-mm mesh net and having a total body length less than 10 mm. Large mesoplankters are those with a body length greater than 1 mm. The midwater trawl used during WEBSEC-70 did not quantitatively retain large mesoplankters, as evidenced by the low frequency and small numbers of copepods *Calanus finmarchicus* s.l. and *Eucalanus bungii* and the chaetognath *Sagitta elegans* in the catches. These mesoplankters were widely distributed and abundant in plankton samples taken with a 0.57-mm mesh plankton net during the same cruise (Wing 1974).

Animals of the macroplankton and micronekton are large enough to be identified with the naked eye. There is no upper size limit and the lower size limit (5-10 mm long) is dependent on the taxa involved and the knowledge of the researcher. Animals of the micronekton are 10-100 mm long and can swim well enough to avoid standard 1-m plankton nets. Because the swimming ability of crustaceans, cephalopods, and fishes increases with size, macroplankton and micronekton are not precisely defined or clearly separable categories. Within the size range of macroplankton and micronekton, the midwater trawl used during WEBSEC-70 would collect quantitatively

only the large scyphomedusans and the hydromedusan *Cuspidella mertensii*. Although herding occurs, much of the macroplankton and micronekton passes through the 6- and 38-mm meshes at the front of the net. Many of the hydromedusan *Aglantha digitale*, the euphausiids, and the mysids undoubtedly passed through the net, although these were the most abundant organisms in the catches (Appendix Table 2). The retention of macroplankton- and micronekton-sized medusans, amphipods, mysids, euphausiids, and shrimps by the midwater trawl used during WEBSEC-70 indicates that they were quite abundant and important in the trophic structure of the area but does not measure their abundance.

Many of the species collected by the midwater trawl in the Chukchi Sea are considered to be benthic animals, i.e., they live on (epibenthos), in (endobenthos), or just off (hyperbenthos) the bottom. Many of the benthic animals, especially polychaetes, mysids, cumaceans, gammarid amphipods, and shrimps, may leave the bottom at night and become part of the macroplankton and micronekton. Except for stations 8 and 14 (Table 1), all sampling was at night; consequently some benthic animals were well represented in the collection.

The shallowness of the area (22-54 m) sampled by WEBSEC-70 contributed to the occurrence of benthic animals in the midwater trawl catches. Benthic animals, which rise off bottom at night, are likely to contribute more to the macroplankton and micronekton in shallow waters than in deeper waters. Additionally, wave-induced turbulence and ice rafting may have placed in suspension some endobenthos (i.e., benthic snails, sipunculids, and echiuroids), which would not normally be off bottom. The net struck bottom only on station 88. Samples from that station contained two species of snails (*Margarites* sp. and *Natica clausa*), a clam (*Nucula*

tenuis). adult hermit crabs (*Pagurus* sp.), and brittle stars (Ophiuroidea) in addition to more usual planktonic species (Table 1, Appendix Table 2).

SUMMARY

One hundred three species of invertebrates were taken in Isaacs-Kidd midwater trawl samples from the southeastern Chukchi Sea during WEBSEC-70. Thirty-three species were taken by otter trawl. Numbers of invertebrate species in a midwater trawl sample varied from 4 to 40 (mean, 17). Amphipods were the most varied group (40 species) and shrimps the next most varied group (14 species).

After removal of hydroid and scyphozoan jellyfishes, euphausiids and mysids contributed the most to the biomass and numbers of the midwater invertebrates retained by the midwater trawl.

ACKNOWLEDGMENTS

We thank Alexander Hoke for the design and execution of the computer program for Appendix Table 2. We thank the U.S. Coast Guard Oceanographic Unit and the Marine Sciences section of the Icebreaker *Glacier* for assistance in collection of samples from the Chukchi Sea at a time of the year not previously sampled.

Hauls approximately 30 min at depth; all hauls except those at station 8 were made with a 6-foot diameter Isaacs-Kidd trawl with 76-mm (stretched measurement) webbing and 13-mm liner. Hauls at station 8 were made on bottom with a shrimp try net, with 10-foot opening and 38-mm webbing. M = multidepth hauls with 6-foot Isaacs-Kidd trawl, B = shrimp try net on bottom, and R = replicated hauls at single depth with 6-foot Isaacs-Kidd trawl.

¹Depth of footrope or depressor.

Appendix Table 2.—Catches of invertebrates by 1.8-m Isaacs-Kidd midwater trawl in the southeastern Chukchi Sea.

NOTES:

Mysis litoralis and *Mysis oculata* both occur in the samples but were not tallied separately and therefore are listed as *Mysis oculata/litoralis*

Size ranges are total body length exclusive of antennae, rostra, and tentacles for most animals except: carapace length of decapod shrimp and bell diameter of medusans.

672. Seasonal occurrence of non-cold-water demersal fishes in a northwestern Florida estuary. By Martin E. Tagatz and F. Peter H. Wilkins. August 1973. iii + 14 p., 1 fig., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
673. Abundance and distribution of inshore benthic fauna of southwestern Long Island, N.Y. By Frank W. Steimle, Jr. and Robert B. Stone. December 1973. iii + 50 p., 2 figs., 5 app. tables.
674. Lake Erie bottom trawl explorations, 1962-66. By Edgar W. Bowman. January 1974. iv + 20 p., 9 figs., 1 table, 7 app. tables.
675. Proceedings of the International British Synopses of Kona, Kona, Hawaii, 9-12 August 1973. Part 1. Report of the Synopses. March 1975. iii + 30 p. Part 2. Review and consolidated paper data. 1974. iv + 355 p. (38 papers). Part 3. Species synopses. June 1975. iv + 159 p. (8 papers). Richard S. Shomon and Francis Williams, editors. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
676. Proce spreads and cost analyses for British and Irish products in different marketing levels. By Erwin S. Penn. March 1974. iii + 44 p., 11 figs., 2 tables, 2 app. figs., 4 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
677. Abundance of benthic macroinvertebrates in two tidal river estuarine areas. By Gail Gilmore and Lee Trent. April 1974. iii + 40 p., 11 figs., 2 tables, 2 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
678. Distribution, abundance, and growth of *Parachanna obscura*, *Onchyrhynchus nerka*, and associated species in the Yukon River drainage, 1961-64. By Robert J. Foss. September 1974. iv + 100 p., 2 figs., 10 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
679. Kinetics and abundance of zooplankton communities in the open icebreaker *Glacier* cruise in the Bering Sea, September-October 1972. By Bruce L. Wing. April 1974. iv + 180 p., 11 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
680. Pelagic amphipod crustaceans from the southeastern Bering Sea, June 1971. By Gerald A. Sänge. July 1974. iii + 50 p., 1 fig., 10 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
681. Physiological response of the clam, *Tresus nutalli*, to varying food rations. October 1974. iv + 85 p., 9 papers, various charts, 10 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
682. Heat exchange between ocean and atmosphere in an estuary, North Pacific for 1963. By N. E. Clark, L. Eber, R. J. Johnson, J. A. Renner, and J. F. Sair. December 1974. iii + 105 p., 2 figs., 10 tables.
683. Bioeconomic relationships for the Maine lobster fishery: a consideration of alternative management schemes. By Robert L. Day, Frederick W. Bell, and Donald M. Harrison. March 1977. iii + 147 p., 2 figs., 25 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
684. Age and size composition of the Atlantic menhaden, *Brevoortia tyrannus*, purse seine catch, 1933-71, with a brief history of the fishery. By William R. Nicholson. June 1975. iv + 28 p., 1 fig., 1 table, 15 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
685. A annotated list of larval and juvenile fishes occurring on the surface of the meroplankton in the North Atlantic Bight during 1961-65. Cruise cruises between May 1961 and February 1965. By M. Paul P. Fahay. March 1977. iv + 80 p., 9 figs., 3 tables, 1 app. table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
686. The fishery resources of the Chesapeake Bay. Government Printing Office, Washington, D.C. 1949.
687. Field station observations on the ecology of tagging experiments in salmonids in America, 1938 and 1943. By Roy E. Nakatani, Gerald J. Lamb, and Richard J. Cole. April 1975. iv + 39 p., 24 figs., 16 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
688. An annotated bibliography of the biology of the menhaden, *Brevoortia tyrannus*, 1967-77. By John W. Reintjes and Peggy M. Keney. April 1978. iii + 100 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
689. Effects of ga Super-starched Columbia River water on the survival of young chinook and coho salmon. By Theodore H. Blahos, Robert J. McConell, and Gene R. Sawyer. April 1975. iii + 22 p., 8 figs., 5 tables, 4 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
690. Observations on the life cycle of Pacific salmon, *Onchyrhynchus* spp., in the Yukon River. Salinity tolerances as shown by tagging experiments conducted in the fisheries of Canada, Japan, and the United States, 1956-63. By Robert A. French, Richard G. Bakkaia, and Doyle F. Sutherland. October 1977. iv + 89 p., 11 figs., 2 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
691. Migrations routes of adult sockeye salmon, *Onchyrhynchus nerka*, in the eastern Bering Sea and Bristol Bay. By Richard R. Straty. April 1974. iii + 20 p., 2 figs., 3 tables, 3 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
692. Seasonal variations of larval flatfishes (Pleuronectiformes) on the continental shelf between Cape Cod, Massachusetts, and Cape Cod Bay, Massachusetts, 1967-68. By W. G. Smith, J. D. Sibunka, and V. Madenjian. December 1974. iv + 68 p., 12 figs., 16 tables.
693. Super-starched water thermograph observations from the Yukon River salmon Dependency Program for 1972. By Steven K. Gamm. August 1975. iii + 33 p., 1 fig. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
694. Ocean and coastal prevailing indices, west coast of North America, 1967-73. By Andrew Baklan. August 1975. iii + 114 p., 3 figs., 6 tables.
695. A water column sampler system with automatic salinity, temperature and depth recording. By Sid Karim. September 1975. iii + 5 p., 7 figs., 1 table.
696. Conditions, surface currents, and movement of skipjack tuna, *Katsuwonus pelamis*, in the Pacific Ocean based on Japanese tuna longline survey data, 1967. By Walle M. Malumoto. October 1975. iii + 26 p., 1 fig., 1 table.
697. Interannual sea surface temperature and weather station V, 1953-72. By James M. Harvey and Carol R. Secko. November 1975. iv + 100 p., 1 fig., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
698. Wind and wave characteristics made by the research vessels *Albatross* and *Heermann*, 19-8-72 from New York to Florida. By William M. Silverman. January 1976. iii + 159 p., 1 table, 2 app. tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
699. Seasonal and monthly fish harvests in Hook Bay, New Jersey. By Joseph A. W. and Mary U. Steimle. January 1976. iv + 16 p., 21 figs., 1 table, 1 app. table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
700. Seasonal and monthly trends of the nests of Vauquelin Island and Washington, as shown by double-recapture experiments, 1964-67. By William M. Steimle, Jr. and James R. Hartness. May 1976. iii + 100 p., 4 figs., 1 table.
