COMMERCIAL FISHERIES REVIEW

A review of developments and news of the fishery industries prepared in the BUREAU OF COMMERCIAL FISHERIES.

Joseph Pileggi, Editor
G. A. Albano and H. Beasley, Assistant Editors

Use of funds for printing this publication has been approved by the Director of the Bureau of the Budget, May 1, 1963.

CONTENTS

COVER: Shows Bering Sea catch of a Japanese trawler. The catch consists mostly of Alaska pollock and arrowtooth flounder (also known as turbot). A few Tanner crab can be seen in lower right hand corner. A total of 14 Japanese bottomfish fleets (2 fish meal fleets and 12 frozen fleets) operated in the Bering Sea in 1964 and caught over 400,000 metric tons of bottomfish, surpassing the 1963 catch by about 100,000 tons. Only about 2,000 tons of halibut and 6,000 tons of sablefish were reported in the 1964 catch which consisted mainly of Alaska pollock, rockfish, flatfish, and herring. Japanese bottomfish operations in the Bering Sea expanded rapidly in 1960 and reached a peak in 1961 when 33 fleets reported a combined catch of over 600,000 tons. Since 1961, fewer Japanese fishing fleets have gone to the Bering Sea, but the size of Japanese catcher vessels in the Bering Sea has increased. Japanese larger stern trawlers (serving as fishing vessels and motherships) made their first appearance in the Bering Sea in 1964.

SALMON TRAVEL

All Atlantic salmon tagged in the Narraguagus River, Maine, by the Maine Atlantic Salmon Commission, that have been recovered outside the river, have been taken in ocean waters and not in other salmon rivers. According to a biologist, several have been recovered in commercial nets in the ocean from the vicinity of Nova Scotia (170 miles), Newfoundland (760 miles), and as far north as 30 miles above the Arctic Circle on the west coast of Greenland.
