Length-frequency distributions for European anchovy (*Engraulis encrasicolus*) in the Gulf of Cádiz, Spain, after recruitment in 1988–2004: boxplots indicate model estimates and solid lines indicate data reported by the International Council for the Exploration of the Sea (ICES). The lengths on the horizontal axis are divided into 6 size classes of 2 cm in total length (TL) from 10 to 22 cm TL: (1) 10–12 cm TL, (2) 12–14 cm TL, (3) 14–16 cm TL, (4) 16–18 cm TL, (5) 18–20 cm TL, and (6) 20–22 cm TL. The ICES data were not used in the model of our study.
