Supplementary Figure 8. Comparison of retained and total catch size compositions for 2018 under harvest control rules (HCRs) HR15 and HR30 for golden king crab (Lithodes aequispinus) in the Aleutian Islands. The median $F$ values at the equilibrium state for respective HCR under scenario 1 were applied to generate the size compositions. In the model used in this analysis, a linear relationship between CPUE and selected abundance is assumed. Plot titles: retained=retained size composition; total=total size composition.
